A Review on Interactive College Enquiry Chatbot

Karan Bhatia¹, Simranjeet Singh Wahi², Divya Ukey³, Akanksha Barmate⁴, Priyanka Dhudhe⁵

U.G. Student, Dept of Computer Science Engineering, JIT College, Lonara, Nagpur, India^{1,2,3,4}

Assistant Professor, Dept of Computer Science Engineering, JIT College, Lonara, Nagpur, India⁵

ABSTRACT: ChatBot, the latest sensation (or just hype!), is believed to be the next paradigm shift in the technology. A conversational assistant will never be Assuming that you have the app now, Say “Hi” to the bot Nice reply isn’t it??. Go ahead and ask “What is yourname?” or “Who are you?” Interesting isn’t it? You can also ask things like—“what is your age?”, “Who created you?” etc. You can also tell your name and you can ask your name back. Feel free to play with it (This simple bot has minimum capabilities, bring out your owncreativity for tuning it).So Our Proposed system is an android based chatting app which will be based on the Android chat experiment with an A.L.I.C.E. artificial intelligence. A.L.I.C.E. (Artificial Linguistic Internet Computer Entity) is an award-winning free natural language artificial intelligence chat robot engine.

I. INTRODUCTION

The system replies using an effective Graphical user interface which implies that as if a real person is talking to the user. The user just has to register himself to the system and has to login to the system. After login user can access to the various helping pages. Various helping pages has the bot through which the user can chat by asking queries related to college activities. The system replies to the user with the help of effective graphical user interface. The user can query about the college related activities through the application. The user can query college related activities such as date and timing of annual day, sports day, and other cultural activities. This system helps the student to be updated about the college activities. The proposed system will also have an online notice board. On this notice board, any Text notices or PDF documents can be displayed. This will help the user to be updated with the important notices. Not much time will be wasted by the user to search for the important notices. The answer to the query will be answered on the basis of the user’s queries and the knowledge base. The important keywords will be fetched from the keywords and the answer to those keywords will be searched in the knowledge base. If the match is found, the relevant answer will be provided to the user or the default message will be shown to the user that “Answer to this query is not available at the moment, please revert back after some time”. The “Keyword Matching” A chat bot (also known as a talk bot, Bot, chatterbox, Artificial Conversational Entity) is a computer program which conducts a conversation via auditory or textual methods. Such programs are often designed to convincingly simulate how a human would behave as a conversational partner, thereby passing the Turing test. Chat bots are typically used in dialog systems [1] for various practical purposes including customer service or information acquisition [2]. Chat bots are often integrated into the dialog systems of, forexample, automated online assistants, giving them the abilityof, for example, small talking or engaging in casualconversations unrelated to the scopes of their primary expertsystems. College Enquiry Chat Bot project will be builtusing artificial intelligence algorithms that will analyse user’s queries and understand user’s message. This system wil be an Android application which will provide answersto the queries of the students. Students will just have toselect the category for the department queries and then askthe query to the bot that will be used for chatting. Artificialintelligence will be used to answer the student’s queries. Thestudent will get the appropriate answers to their queries. Theanswers will be give using the built in artificial intelligencealgorithms. Students won’t have to go to the college to makethe enquiry.algorithm will be used to match the keywords from theknowledge base In some cases, user may find out that theanswer given to his/her query is not relevant. In such cases,the user can mark this answer as Invalid, and an instance ofthis invalid answer will be sent to the Admin panel at thesame time. Whenever Admin will

log in, he will get to see the answers which are marked invalid and then he can do the necessary changes to the knowledge base so that user will get the proper result when he will ask the same query next time. The aim of our Proposed System is to develop an Android based bot Application, which provides answer to the query of the student very effectively. Students just have to put their query to the bot which is used for chatting. This system will use the artificial intelligence algorithms to give appropriate answers to the user. If the answer is found invalid, then some system to declare the answer as invalid can be incorporated. These invalid answers can be deleted or modified by the admin of the system. The student will not have to go to the college for enquiring something. Student can use the chat bot to get the answers to their queries. Students can use this Android based system for making enquiries at any point of time. This system may help students to stay updated with the college activities.

II. RELATED WORK

A.L.I.C.E. (Artificial Linguistic Internet Computer Entity): A.L.I.C.E. (Artificial Linguistic Internet Computer Entity) which is an award winning open source natural language artificial intelligence chat robot which utilizes AIML (Artificial Intelligence Markup Language) to form responses to queries. Alice bot engine and AIML are freely available under the terms of the GNU General Public License (used by GNU/Linux and thousands of other software projects). The A.L.I.C.E. project includes hundreds of contributors from around the world. This is the general Chabot available in the industry which can be used for various purposes. But, there is no Chabot for making college enquiries. Thus, we are designing a Chabot which will help students to do necessary enquiries without even going to the college.

Sr. No.	Paper	Author	Review
1	Example - based chat oriented dialogue system with personalized long-term Memory-2016	J. Bang, H. Noh, Y. Kim and G. G. Lee,	proposed three features: POS-tagged tokens for sentence matching, using NE types and values for searching proper responses, and using back-off responses for unmatched user utterances
2	Designing a Chat-bot that Simulates an Historical Figure-2014	E. Haller and T. Rebedea,	Developed a historical figure for building a conversational agent that could be used in middle-school scenarios
3	Keyword-based search and exploration on databases-2012	Y. Chen, W. Wang and Z. Liu,	keyword-based search and top-k query processing has been applied for exploring Knowledge base

III. DESIGN

The interactive college enquiry chatbot will take the query from the user and will give the appropriate answer to the user query. The user can even mark the answer given by system as invalid, if he/she finds that the answer is not relevant to the query.

The user will just have to visit the web page of chat bot and interact with the bot to get the answers to their query.

Our Proposed system will have two types of users.

- First type of the user will be the Admin, who will handle the entire system, and the other type of the user will be Students.
- There will be two types of students, registered ones and unregistered ones.
 - The registered users will have to log in using the User ID and Password provided to them and after successfully logging in, student can ask his queries.
 - The unregistered users will have to first register themselves in the system by filling up the simple registration form. Then after successful registration, the student can ask his queries.

It has a Knowledge based which will contain information about the College. A.L.I.C.E (Artificial Linguistic Internet Computer Entity) which is an award winning open source natural language artificial intelligence chat robot will be used which utilizes AIML (Artificial Intelligence Markup Language) to form responses to queries.

IV.METHODOLOGY

The incremental build model is a method of software development where the product is designed, implemented and tested incrementally (a little more is added each time) until the product is finished. This model combines the elements of the waterfall model with the iterative philosophy of prototyping. The basic algorithm that will be implemented for working of this proposed system is as follows:

Step 1: Start.

Step 2: Get the user query. (INPUT)

Step 3: Pre-processing of the query E.g. suppose there is this year” So, we are going to remove these stop words like „is“, „the“ using pre-processing technique.

Step 4: Fetch the remaining only keywords from the query.

Step 5: Match the fetched keywords with the keywords in Knowledge base, and provide an appropriate response. The keywords will be matched with the help of keyword matching algorithm.

Step 6: Return the query response as an output to the user.

Step 7: Exit.

FUTURE SCOPE

In the future scope of this project, we can include voice based queries. The users will have to give voice input and the system will give the text output and while giving it, it will give a voice output as well.

V.CONCLUSION

The Proposed System will be based on Alice and AIML algorithm that will be used to identify answers related to user submitted questions. The need is to develop a database where all the related data will be stored and to develop a User Interface. The Android interface developed will have two parts, one for simple users and one for the administrator. A background research took place, which included an overview of the conversation procedure and any relevant chat bots available. A database will be developed, which will store information about questions, answers, keywords, logs and feedback messages.
