#### Abstract

The aim of this paper is to introduce the concepts of closed sets in bitopological space called ( $\mathrm{i}, \mathrm{j}$ ) generalized star $b \omega$ - closed sets, $(i, j)$ - generalized star $b \omega$ - open sets and study their basic properties.

KEYWORDS : $(\mathrm{i}, \mathrm{j})$ - generalized star $\mathrm{b} \omega$ - closed sets, $(\mathrm{i}, \mathrm{j})$ - generalized star $\mathrm{b} \omega$ - open sets.

## I. INTRODUCTION

Generalized closed sets form a stronger tool in the characterization of bitopological spaces. The study of bitopological spaces was initiated by Kelly [8] and thereafter a large number of papers have been done to generalize the topological concepts to bitopological setting. Fukutake [5] introduced g-closed sets in bitopological spaces. Abo Khadra and Nasef [1] discussed b - open sets in bitopological spaces. Alswidi et al. [2] introduced a new notions on an $\mathrm{ij}-\omega$ - closed sets in bitopological spaces.
In this paper, a new class of sets in bitopological spaces called (i,j) - $g * b \omega$ - closed sets is introduced. A comparative study has been done with already existing closed sets and $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed sets.

## II. PRELIMINARIES

A triple ( $\mathrm{X}, \tau_{1}, \tau_{2}$ ) where X is a non empty set and $\tau_{1}$ and $\tau_{2}$ are topologies on X is called a bitopological space. For a subset A of $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$, the closure of A and the interior of A with respect to $\tau_{i}$ is denoted by $\mathrm{i}-\mathrm{cl}(\mathrm{A})$ and $\mathrm{i}-\operatorname{int}(\mathrm{A})$ respectively for $\mathrm{i}=1,2$. The intersection of all $\tau_{i}$ - closed sets containing A is called $\mathrm{i}-\mathrm{cl}(\mathrm{A})$. The union of all $\tau_{i}-$ open sets contained in A is $\mathrm{i}-\operatorname{int}(\mathrm{A})$.

Definition 2.1 For $\mathrm{i}, \mathrm{j}=1,2$ and $\mathrm{i} \neq \mathrm{j}$, a subset A of a bitopological space $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is called
(i) (i, j) - semi closed (Maheswari et al., 1977-78) if j - int(i-cl(A)) $\subseteq \mathrm{A}$.
(ii) $\quad(\mathbf{i}, \mathbf{j})-\alpha-\operatorname{closed}[7]$ if $\mathrm{i}-\operatorname{cl}(\mathrm{j}-\operatorname{int}(\mathrm{i}-\operatorname{cl}(\mathrm{A}))) \subseteq \mathrm{A}$.
(iii) (i, j) - pre closed [7] if i-cl(j - int(A)) $\subseteq A$.
(iv) $\quad(\mathbf{i}, \mathbf{j})-$ regular closed $[4]$ if i $-\operatorname{cl}(\mathrm{j}-\operatorname{int}(\mathrm{A})) \subseteq \mathrm{A}$.
(v) $\quad(\mathbf{i}, \mathbf{j})-\mathbf{b}-\operatorname{closed}[3]$ if $(\mathrm{j}-\operatorname{int}(\mathrm{i}-\operatorname{cl}(\mathrm{A}))) \cup(\mathrm{i}-\operatorname{cl}(\mathrm{j}-\operatorname{int}(\mathrm{A}))) \subseteq \mathrm{A}$.

## (An ISO 3297: 2007 Certified Organization)

## Vol. 3, I ssue 5, May 2014

The complements of the above mentioned sets are called (i, $j$ ) - semi open, (i, $j$ ) - $\alpha$ - open, (i, $j$ ) - pre open, (i, j) - regular open and (i, j) - b-open sets respectively.

The intersection of all $\tau_{j}$ - semi closed (resp. $\tau_{j}-\alpha-$ closed, $\tau_{j}$ - pre closed, $\tau_{j}$ - regular closed and $\tau_{j}-\mathrm{b}$ - closed) subsets of $(\mathrm{X}, \tau)$ containing A is called the $\tau_{j}$ - semi closure (resp. $\tau_{j}-\alpha$ - closure, $\tau_{j}$ - pre closure, $\tau_{j}$ - regular closure and $\tau_{j}-\mathrm{b}$ closure) of A and is denoted by $\tau_{j}-\operatorname{scl}(\mathrm{A})\left(\operatorname{resp} . \tau_{j}-\alpha \mathrm{cl}(\mathrm{A}), \tau_{j}-\operatorname{pcl}(\mathrm{A}), \tau_{j}-\operatorname{rcl}(\mathrm{A})\right.$ and $\left.\tau_{j}-\operatorname{bcl}(\mathrm{A})\right)$.

Definition 2.2 For $\mathrm{i}, \mathrm{j}=1$, 2 and $\mathrm{i} \neq \mathrm{j}$, a subset A of a bitopological space $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is called
(i) (i, j) - generalized closed (briefly, (i, $\mathbf{j})-\mathbf{g}$ - closed) $[5]$ if $\tau_{j}-\operatorname{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}$ open in X .
(ii) (i, j) - regular generalized closed (briefly, (i, $\mathbf{j}) \mathbf{- r g}$ - closed) [3] if $\tau_{j}-\mathrm{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}$ - regular open in X .
(iii) (i, $\mathbf{j}$ ) - weakly generalized closed (briefly, (i, $\mathbf{j}$ ) - wg - closed) [6] if $\tau_{j}-\operatorname{cl}(\mathrm{A})\left[\tau_{i}-\operatorname{int}(\mathrm{A})\right] \subseteq \mathrm{U}$ whene 1 ver $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}$ - open in X .
(iv) (i, j) - generalized star closed (briefly, (i, j) - $\mathbf{g}^{*}$ - closed) [13] if $\tau_{j}-\operatorname{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}-\mathrm{g}$ - open in X.
(v) (i, j) - generalized $\alpha$ - closed (briefly, (i, j) - g $\alpha$ - closed) [9] if $\tau_{j}-\alpha \operatorname{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}-\alpha$ - open in X .
(vi) $\quad(\mathbf{i}, \mathbf{j})-\alpha$ - generalized closed (briefly, (i, $\mathbf{j})-\alpha \mathbf{- c l o s e d})[12]$ if $\tau_{j}-\alpha \operatorname{cl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}$ - open in X.
(vii) (i, $\mathbf{j}$ ) - generalized star pre closed (briefly, (i, $\left.\mathbf{j})-\mathbf{g}^{*} \mathbf{p}-\mathbf{c l o s e d}\right)[14]$ if $\tau_{j}-\operatorname{pcl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}-\mathrm{g}$ - open in X .
(viii) (i, $\mathbf{j})$ - generalized star semi closed (briefly, $\left.(\mathbf{i}, \mathbf{j})-\mathbf{g}^{*} \mathbf{s} \mathbf{- c l o s e d}\right)[12]$ if $\tau_{j}-\operatorname{scl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}$ - gs - open in X .
(ix) $\quad(\mathbf{i}, \mathbf{j})$ - generalized ${ }^{\#}$ semi closed (briefly, (i, $\left.\left.\mathbf{j}\right)-\mathbf{g}^{\#} \mathbf{s}-\mathbf{c l o s e d}\right)[15]$ if $\tau_{j}-\operatorname{scl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}-\alpha \mathrm{g}$ - open in X .

The complement of the above mentioned sets are called their respective open sets.

## III. (i, j) - $\mathbf{g * b} \mathbf{~} \boldsymbol{-}$ CLOSED SETS

In this section, the concept of $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed sets in bitopological spaces is defined and some of their characterizations and properties are studied.

Definition 3.1 A subset A of a bitopological space ( $\mathrm{X}, \tau_{1}, \tau_{2}$ ) is called (i,j) - generalized star bomega closed (briefly, (i, $\mathbf{j}$ ) - $\mathbf{g} * \mathbf{b} \boldsymbol{\omega} \boldsymbol{- c l o s e d})$ if $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \subseteq \mathrm{U}$ whenever $\mathrm{A} \subseteq \mathrm{U}$ and U is $\tau_{i}-\mathrm{gs}$ - open in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$, where $\mathrm{i}, \mathrm{j}=1,2$ and $\mathrm{i} \neq \mathrm{j}$.

The set of all $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed sets in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is denoted by $\mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(\mathrm{i}, \mathrm{j})$.
Remark 3.2 By setting $\tau_{i}=\tau_{j}$ in definition 3.1, an $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set is a $\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set [11].

Example 3.3 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$. Then $\varphi, \mathrm{X}$, $\{b\},\{c\},\{b, c\}$ are $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

## Vol. 3, I ssue 5, May 2014

Theorem 3.4 Every $\tau_{j}$ - closed (resp. $\tau_{j}$ - semi closed, $\tau_{j}-\alpha$ - closed, $\tau_{j}$ - pre closed, $\tau_{j}$ - regular closed) set in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is (i, j) - $\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

Proof: Let A be $\tau_{j}$ - closed (resp. $\tau_{j}$ - semi closed, $\tau_{j}-\alpha$ - closed, $\tau_{j}$ - pre closed, $\tau_{j}$ - regular closed) in (X, $\tau_{1}, \tau_{2}$ ) such that $\mathrm{A} \subseteq \mathrm{U}$, where U is $\tau_{i}$ - gs - open. Since A is $\tau_{j}$ - closed (resp. $\tau_{j}$ - semi closed, $\tau_{j}-\alpha$ - closed, $\tau_{j}$ - pre closed, $\tau_{j}$ - regular closed), $\tau_{j}-\operatorname{cl}(\mathrm{A})\left(\right.$ resp. $\left.\tau_{j}-\operatorname{scl}(\mathrm{A}), \tau_{j}-\alpha \mathrm{cl}(\mathrm{A}), \tau_{j}-\operatorname{pcl}(\mathrm{A}), \tau_{j}-\operatorname{rcl}(\mathrm{A})\right)=\mathrm{A} \subseteq \mathrm{U}$. But $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \subseteq \tau_{j}-\operatorname{cl}(\mathrm{A})\left(\right.$ resp. $\tau_{j}-$ $\left.\operatorname{scl}(\mathrm{A}), \tau_{j}-\alpha \mathrm{cl}(\mathrm{A}), \tau_{j}-\operatorname{pcl}(\mathrm{A}), \tau_{j}-\operatorname{rcl}(\mathrm{A})\right)$. Therefore $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \subseteq \mathrm{U}$. Hence A is an $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega-\operatorname{closed}$ set in $\left(\mathrm{X}, \tau_{1}\right.$, $\tau_{2}$ ).

The converse of the above theorem is not true in general as can be seen from the following examples:
Example 3.5 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\},\{a, b\}\}$. The subsets $\{\mathrm{b}\}$ is $(1,2)-\mathrm{g} * \mathrm{~b} \omega$ - closed but not $\tau_{2}$ - closed.

Example 3.6 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. The subsets $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)-$ $\mathrm{g} * \mathrm{~b} \omega$ - closed but not $\tau_{2}$ - semi closed.

Example 3.7 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$. The subsets $\{\mathrm{a}\},\{\mathrm{b}\}$ are $(1,2)-\mathrm{g} * \mathrm{~b} \omega$ - closed but not $\tau_{2}-\alpha-$ closed, not $\tau_{2}$ - pre closed and not $\tau_{2}$ - regular closed.

Theorem 3.8 Every $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~s}-\operatorname{closed}$ set in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - closed.
Proof: Let $\mathrm{A} \subseteq \mathrm{U}$ and U be $\tau_{i}-\mathrm{gs}-$ open in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$. Since A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~s}-\operatorname{closed}$ in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right), \tau_{j}-\operatorname{scl}(\mathrm{A}) \subseteq \mathrm{U}$. But $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \subseteq \tau_{j}-\operatorname{scl}(\mathrm{A}) \subseteq \mathrm{U}$. Therefore A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

The converse of the above theorem is not true in general as can be seen from the following example:
Example 3.9 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\}\}$. The subsets $\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{a}$, $\mathrm{b}\}$ and $\{\mathrm{a}, \mathrm{c}\}$ are $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed but not $(1,2)-\mathrm{g}^{*} \mathrm{~s}$ - closed.

Remark 3.10 The following examples show that $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set is independent from (i, j$)$ - semi closed set, ( $\mathrm{i}, \mathrm{j}$ ) $\alpha$ - closed set and (i, j) - pre closed set.

Example 3.11 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)$ - semi closed, $(1,2)-\alpha$ - closed and $(1,2)-$ pre closed but not $(1,2)-\mathrm{g} * \mathrm{~b} \omega$ - closed.

Example 3.12 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is (1, 2) $\mathrm{g}^{*} \mathrm{~b} \omega$ - closed but not $(1,2)-$ semi closed, not $(1,2)-\alpha-$ closed and not $(1,2)$ - pre closed.

Remark 3.13 The following examples show that $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set is independent from $(\mathrm{i}, \mathrm{j})$ - regular closed set and (i, j) - g - closed set, (i, j) - wg - closed.

Example 3.14 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)$ - regular closed and $(1,2)-\mathrm{g}-\operatorname{closed}(1,2)-\mathrm{wg}-\operatorname{closed}$ but not $(1,2)-\mathrm{g} * \mathrm{~b} \omega-$ closed.

# International Journal of Innovative Research in Science, Engineering and Technology 

## (An ISO 3297: 2007 Certified Organization)

## Vol. 3, I ssue 5, May 2014

Example 3.15 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$. The subset $\{\mathrm{b}\}$ is $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed but not $(1,2)-$ regular closed and not $(1,2)-\mathrm{g}-\operatorname{closed}$, not $(1,2)-\mathrm{wg}-\mathrm{closed}$.

Remark 3.16 The following examples show that $(i, j)-g * b \omega$ - closed set is independent from (i, $j$ ) - rg - closed set and (i, j) - $\mathrm{g}^{*}$ - closed set.

Example 3.17 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)-r g-\operatorname{closed}(1,2)-g^{*}-$ closed but not $(1,2)-g^{*} b \omega$ - closed.

Example 3.18 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. The subset $\{\mathrm{b}\}$ is $(1,2)-\mathrm{g} * \mathrm{~b} \omega$ - closed but not $(1,2)-\mathrm{rg}-$ closed, not $(1,2)-\mathrm{g}^{*}-$ closed.

Remark 3.19 The following examples show that $(i, j)-g^{*} b \omega$ - closed set is independent from (i, $j$ ) - $g \alpha$ - closed set and (i, j) - $\mathrm{g}^{*} \mathrm{p}$ - closed set.

Example 3.20 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\}\}$. The subset $\{a, c\}$ is $(1,2)-\mathrm{g} \alpha-$ closed and $(1,2)-\mathrm{g}^{*} \mathrm{p}$ - closed but not $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

Example 3.21 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$. The subsets $\{\mathrm{a}\},\{\mathrm{b}\}$ are $(1,2)-\mathrm{g} * \mathrm{~b} \omega-$ closed but not $(1,2)-\mathrm{g} \alpha-\operatorname{closed}$ and not $(1,2)-\mathrm{g} * \mathrm{p}$ - closed.

Remark 3.22 The following examples show that the concepts (i, j) - $\alpha \mathrm{g}$ - closed set and (i, j) - $\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set are independent.

Example 3.23 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\},\{a, b\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)-\alpha \mathrm{g}$ - closed but not $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$-closed.

Example 3.24 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$. The subsets $\{\mathrm{a}\},\{\mathrm{b}\}$ are $(1,2)-\mathrm{g} * \mathrm{~b} \omega$ - closed but not $(1,2)-\alpha \mathrm{g}$ - closed.

Remark 3.25 The following examples show that the concepts (i, j) - $g^{\#} s-$ closed set and $(i, j)-g^{*} b \omega$ - closed set are independent.

Example 3.26 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\},\{a, b\}\}$. The subset $\{\mathrm{a}, \mathrm{c}\}$ is $(1,2)-\mathrm{g}^{\#} \mathrm{~s}-$ closed but not $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

Example 3.27 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\}\}$. The subsets $\{\mathrm{b}\}$, $\{\mathrm{c}\}$, $\{\mathrm{a}, \mathrm{b}\}$ and $\{\mathrm{a}, \mathrm{c}\}$ are $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed but not $(1,2)-\mathrm{g}^{\#} \mathrm{~s}-\mathrm{closed}$.

# International Journal of Innovative Research in Science, Engineering and Technology 

## (An ISO 3297: 2007 Certified Organization)

## Vol. 3, I ssue 5, May 2014

The following diagram shows the relationships of $(i, j)-g * b \omega$ - closed sets with other sets:

where $\mathrm{A} \longrightarrow \mathrm{B}$ represents A implies B and $\mathrm{A} \longleftrightarrow \longmapsto \mathrm{B}$ represents A and B are independent.

Remark 3.28 Union of two $(i, j)-g^{*} b \omega$ - closed sets need not be $(i, j)-g^{*} b \omega$ - closed as can be seen from the following example:

Example 3.29 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$. Let $\mathrm{A}=\{\mathrm{a}\}$ and $B=\{b\}$. Then $A \cup B=\{a, b\}$ is not $(1,2)-g^{*} b \omega-$ closed but $A=\{a\}$ and $B=\{b\}$ are $(1,2)-g^{*} b \omega$ - closed.

Remark 3.30 Difference of two ( $\mathrm{i}, \mathrm{j}$ ) $-\mathrm{g} * \mathrm{~b} \omega$ - closed sets need not be $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set as can be seen from the following example:

Example 3.31 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\}\}$. Let $\mathrm{A}=\{\mathrm{a}, \mathrm{c}\}$ and $\mathrm{B}=\{\mathrm{c}\}$. Then $A$ and $B$ are $(1,2)-g^{*} b \omega$ - closed but $A \backslash B=\{a\}$ is not $(1,2)-g^{*} b \omega$ - closed.

Theorem 3.32 If a subset A of a bitopological space $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-\operatorname{closed}$ then $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ contains no nonempty $\tau_{i}$ - gs - closed set.

Proof: Let A be an $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - closed set and F be a $\tau_{i}-\mathrm{gs}$ - closed set such that $\mathrm{F} \subseteq \tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$. Therefore $\mathrm{A} \subseteq \mathrm{F}^{\mathrm{c}}$ and $\mathrm{F} \subseteq \tau_{j}-\mathrm{bcl}(\mathrm{A})$. Since $\mathrm{F}^{\mathrm{c}}$ is $\tau_{i}-\mathrm{gs}-$ open and A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - closed, $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \subseteq \mathrm{F}^{\mathrm{c}}$. Thus $\mathrm{F} \subseteq\left[\tau_{j}-\mathrm{bcl}(\mathrm{A})\right]^{\mathrm{c}}=\mathrm{X}$ $\backslash\left[\tau_{j}-\operatorname{bcl}(\mathrm{A})\right]$. Hence $\mathrm{F} \subseteq\left[\tau_{j}-\operatorname{bcl}(\mathrm{A})\right] \cap\left[\mathrm{X} \backslash\left[\tau_{j}-\mathrm{bcl}(\mathrm{A})\right]\right]=\varphi$. Therefore $\mathrm{F}=\varphi$. Hence $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ contains no nonempty $\tau_{i}$ - gs - closed set.

Theorem 3.33 Let A be an (i, j) - $\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$. Then A is $\tau_{j}-\mathrm{b}-\operatorname{closed}$ if and only if $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ is $\tau_{i}$-gs - closed in (X, $\tau_{1}, \tau_{2}$ ).

Proof: Suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-$ closed. Let A be $\tau_{j}-\mathrm{b}-\operatorname{closed}$. Then $\tau_{j}-\operatorname{bcl}(\mathrm{A})=\mathrm{A}$. Therefore $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}=$ $\varphi$ is $\tau_{i}$-gs - closed in ( $\mathrm{X}, \tau_{1}, \tau_{2}$ ).

# International Journal of Innovative Research in Science, Engineering and Technology 

## (An ISO 3297: 2007 Certified Organization)

## Vol. 3, I ssue 5, May 2014

Conversely, suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-$ closed and $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ is $\tau_{i}-\mathrm{gs}-$ closed. Since A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-\mathrm{closed}, \tau_{j}$ $-\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}$ contains no nonempty $\tau_{i}-\mathrm{gs}-\operatorname{closed}$ set (by Theorem 3.32). Since $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}$ is $\tau_{i}-\mathrm{gs}-\mathrm{closed}, \tau_{j}-$ $\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}=\varphi$. Then $\tau_{j}-\operatorname{bcl}(\mathrm{A})=\mathrm{A}$. Hence A is $\tau_{j}-\mathrm{b}-$ closed.

Theorem 3.34 Let A and B be subsets of $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ such that $\mathrm{A} \subseteq \mathrm{B} \subseteq \tau_{j}-\mathrm{bcl}(\mathrm{A})$. If A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed then B is $(\mathrm{i}$, j) $-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

Proof: Let A and B be subsets such that $\mathrm{A} \subseteq \mathrm{B} \subseteq \tau_{j}-\mathrm{bcl}(\mathrm{A})$. Suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed. Let $\mathrm{B} \subseteq \mathrm{U}$ and U be $\tau_{i}$ - gs - open in $\left(X, \tau_{1}, \tau_{2}\right)$. Then $\mathrm{A} \subseteq \mathrm{U}$. Since A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-\operatorname{closed}, \tau_{j}-\operatorname{bcl}(\mathrm{A}) \subseteq \mathrm{U}$. Since $\mathrm{B} \subseteq \tau_{j}-\mathrm{bcl}(\mathrm{A}), \tau_{j}-$ $\operatorname{bcl}(\mathrm{B}) \subseteq \tau_{j}-\mathrm{bcl}\left[\tau_{j}-\operatorname{bcl}(\mathrm{A})\right]=\tau_{j}-\mathrm{bcl}(\mathrm{A}) \subseteq \mathrm{U}$. Therefore B is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-$ closed.

Remark 3.35 In general an $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set need not be equal to an $(\mathrm{j}, \mathrm{i})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed set.
Example 3.36 consider $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$. Then the subsets $\{a\}$ and $\{a, c\}$ are $(1,2)-g^{*} b \omega$ - closed but not $(2,1)-g^{*} b \omega$-closed.

Theorem 3.37 If $\tau_{1} \subseteq \tau_{2}$ in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ then $\mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(2,1) \subseteq \mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(1,2)$.
Proof: Let $\mathrm{A} \in \mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(2,1)$. Let $\mathrm{U} \in \mathrm{GSO}\left(\mathrm{X}, \tau_{1}\right)$ such that $\mathrm{A} \subseteq \mathrm{U}$. Since $\mathrm{GSO}\left(\mathrm{X}, \tau_{1}\right) \subseteq \mathrm{GSO}\left(\mathrm{X}, \tau_{2}\right), \mathrm{U} \in \mathrm{GSO}\left(\mathrm{X}, \tau_{2}\right)$. Since A is $(2,1)-\mathrm{g} * \mathrm{~b} \omega$ - closed, $\tau_{1}-\operatorname{bcl}(\mathrm{A}) \subseteq \mathrm{U}$. Since $\tau_{1} \subseteq \tau_{2}, \tau_{2}-\operatorname{bcl}(\mathrm{A}) \subseteq \tau_{1}-\operatorname{bcl}(\mathrm{A})$. Thus $\tau_{2}-\mathrm{bcl}(\mathrm{A}) \subseteq \mathrm{U}$. Hence $A$ is $(1,2)-g^{*} b \omega$ - closed. That is, $A \in G^{*} b \omega C(1,2)$.

The converse of the above theorem need not be true as seen from the following example:
Example 3.38 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with the topologies $\tau_{1}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}$ and $\tau_{2}=\{\varphi, \mathrm{X},\{\mathrm{a}\},\{\mathrm{a}, \mathrm{b}\}\}$. Then $\mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(2,1) \subseteq \mathrm{G}^{*} \mathrm{~b} \omega \mathrm{C}(1,2)$ but $\tau_{1} \nsubseteq \tau_{2}$.

## IV. $(\mathbf{i}, \mathbf{j})-\mathbf{g}^{*} \mathbf{b} \omega$ - OPEN SETS

In this section, $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - open sets in bitopological spaces is introduced and their properties are studied.
Definition 4.1 A set A of a bitopological space ( $\mathrm{X}, \tau_{1}, \tau_{2}$ ) is called (i, $\left.\boldsymbol{j}\right)$ - generalized star $\boldsymbol{b}$ omega open (briefly, ( $\mathbf{i}, \mathbf{j}$ ) $\mathbf{g}^{*} \mathbf{b} \omega$ - open) if its complement is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - closed.

The set of all $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - open sets in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ is denoted by $\mathrm{G}^{*} \mathrm{~b} \omega \mathrm{O}(\mathrm{i}, \mathrm{j})$.
Theorem 4.2 A subset A of a bitopological space ( $\mathrm{X}, \tau_{1}, \tau_{2}$ ) is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - open if and only if $\mathrm{F} \subseteq \tau_{j}$ - bint(A) whenever $\mathrm{F} \subseteq \mathrm{A}$ and F is $\tau_{i}-\mathrm{gs}-$ closed in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$.

Proof: Suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ - open. Let $\mathrm{F} \subseteq \mathrm{A}$ and F be $\tau_{i}$ - gs - closed. Then $\mathrm{A}^{\mathrm{c}} \subseteq \mathrm{F}^{\mathrm{c}}$ and $\mathrm{F}^{\mathrm{c}}$ is $\tau_{i}$ - gs - open. Since $\mathrm{A}^{\mathrm{c}}$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega-\operatorname{closed}, \tau_{j}-\operatorname{bcl}\left(\mathrm{A}^{\mathrm{c}}\right) \subseteq \mathrm{F}^{\mathrm{c}}$. Since $\tau_{j}-\operatorname{bcl}\left(\mathrm{A}^{\mathrm{c}}\right)=\left[\tau_{j}-\operatorname{bint}(\mathrm{A})\right]^{\mathrm{c}},\left[\tau_{j}-\operatorname{bint}(\mathrm{A})\right]^{\mathrm{c}} \subseteq \mathrm{F}^{\mathrm{c}}$. Hence $\mathrm{F} \subseteq \tau_{j}$ $-\operatorname{bint}(\mathrm{A})$.

Conversely, suppose that $\mathrm{F} \subseteq \tau_{j}-\operatorname{bint}(\mathrm{A})$ whenever $\mathrm{F} \subseteq \mathrm{A}$ and F is $\tau_{i}-\mathrm{gs}-\operatorname{closed}$ in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$. Let U be $\tau_{i}-\mathrm{gs}-$ open in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ and $\mathrm{A}^{\mathrm{c}} \subseteq \mathrm{U}$. Then $\mathrm{U}^{\mathrm{c}}$ is $\tau_{i}$ - gs - closed and $\mathrm{U}^{\mathrm{c}} \subseteq \mathrm{A}$. Hence by assumption $\mathrm{U}^{\mathrm{c}} \subseteq \tau_{j}-\operatorname{bint}(\mathrm{A})$. That is $\tau_{j}-$ $\operatorname{bcl}\left(A^{c}\right) \subseteq U$. Therefore $A^{c}$ is $(i, j)-g^{*} b \omega$ - closed. Hence $A$ is $(i, j)-g^{*} b \omega$ - open.

Theorem 4.3 If a subset A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega-\operatorname{closed}$ in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ then $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega-$ open.

Proof: Suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - closed in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$. Let $\mathrm{F} \subseteq \tau_{j}-\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}$ and F be $\tau_{i}-\mathrm{gs}-$ closed. Since A is ( i , $\mathrm{j})-\mathrm{g} * \mathrm{~b} \omega-$ closed, $\tau_{j}-\mathrm{bcl}(\mathrm{A}) \backslash \mathrm{A}$ does not contain nonempty $\tau_{i}-\mathrm{gs}-$ closed sets (by Theorem 3.32). Hence $\mathrm{F}=\varphi$. Thus F $\subseteq \tau_{j}-\operatorname{bint}\left[\tau_{j}-\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}\right]$. Hence $\tau_{j}-\operatorname{bcl}(\mathrm{A}) \backslash \mathrm{A}$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - open.

Theorem 4.4 If a set A is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega-$ open in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ then $\mathrm{G}=\mathrm{X}$ whenever G is $\tau_{i}-\mathrm{gs}-$ open and $\tau_{j}-\operatorname{bint}(\mathrm{A}) \cup \mathrm{A}^{\mathrm{c}}$ $\subseteq$ G.

Proof: Suppose that A is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - open in $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right), \mathrm{G}$ is $\tau_{i}$ - gs - open and $\tau_{j}$ - $\operatorname{bint}(\mathrm{A}) \cup \mathrm{A}^{\mathrm{c}} \subseteq \mathrm{G}$. Then $\mathrm{G}^{\mathrm{c}} \subseteq\left\{\tau_{j}-\right.$ $\left.\operatorname{bint}(A) \cup A^{c}\right\}^{c}=\tau_{j}-\operatorname{bcl}\left(A^{c}\right) \backslash A^{c}$. Since $A^{c}$ is $(i, j)-g^{*} b \omega-\operatorname{closed}, \tau_{j}-\operatorname{bcl}\left(A^{c}\right) \backslash A^{c}$ contains no nonempty $\tau_{i}-\mathrm{gs}$ - closed set in $\left(X, \tau_{1}, \tau_{2}\right)$ (by Theorem 3.32). Therefore $\mathrm{G}^{\mathrm{c}}=\varphi$. Hence $\mathrm{G}=\mathrm{X}$.

Remark 4.5 The converse of the above theorem is not true in general as can be seen from the following example:
Example 4.6 Let $X=\{a, b, c\}$ with the topologies $\tau_{1}=\{\varphi, X,\{a\},\{a, b\}\}$ and $\tau_{2}=\{\varphi, X,\{a\},\{b\},\{a, b\}\}$. Let $A=\{c\}$ and $\mathrm{G}=\mathrm{X}$. Then G is $\tau_{1}-\mathrm{gs}-$ open, $\tau_{2}-\operatorname{bint}(\mathrm{A}) \cup \mathrm{A}^{\mathrm{c}}=\varphi \cup\{\mathrm{a}, \mathrm{b}\}=\{\mathrm{a}, \mathrm{b}\} \subseteq \mathrm{G}$, but $\mathrm{A}=\{\mathrm{c}\}$ is not $(1,2)-\mathrm{g}^{*} \mathrm{~b} \omega-$ open.

Theorem 4.7 Let $\left(\mathrm{X}, \tau_{1}, \tau_{2}\right)$ be a bitopological space. If $\mathrm{x} \in \mathrm{X}$ then singleton $\{\mathrm{x}\}$ is either $\tau_{i}-\mathrm{gs}-\mathrm{closed}$ or $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ open.

Proof: Let $\mathrm{x} \in \mathrm{X}$ and suppose that $\{\mathrm{x}\}$ is not $\tau_{i}$-gs - closed. Then $\mathrm{X} \backslash\{\mathrm{x}\}$ is not $\tau_{i}$-gs -open. Consequently, X is the only $\tau_{i}$ - gs - open set containing the set $\mathrm{X} \backslash\{\mathrm{x}\}$. Therefore $\mathrm{X} \backslash\{\mathrm{x}\}$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g} * \mathrm{~b} \omega$ - closed. Hence $\{\mathrm{x}\}$ is $(\mathrm{i}, \mathrm{j})-\mathrm{g}^{*} \mathrm{~b} \omega$ open.

## V. CONCLUSION

In this research, we introduce the concept of $\mathrm{g}^{*} \mathrm{~b} \omega$ - continuous, closed maps in these spaces and present some results.
