#### Abstract

Azam et al. (2011), introduce the notion of complex valued metric spaces and obtained common fixed point result for mappings in the context of complex valued metric spaces. In this paper we prove common fixed point theorems for six maps in complex valued metric space satisfying commuting and weakly compatible mappingwith different type of inequality,our result generalizes the result of Tiwari et al.[8]

KEYWORDS: commuting mapping, weakly compatible maps, common fixed points, complete complex valued metric space

## I. INTRODUCTION

#### Abstract

Banach contraction principle was the starting point for many researchers during last few decades in the field of nonlinear analysis. The concept of complex valued metric pace which is a generalization of the classical metric space was recently introduced by Azam, Fisher and khan[1]. The study of metric space expressed the most common important role to many fields both in pure and applied science [3]. Abounding researchers extended the notion of a metric space such as vector valued metric space of Perov [2], a cone metric spaces of Huang and Zhang [6], a modular metric spaces of Chistyakov[10], etc. For the sake of completeness we recollect some basic definitions and fundamentals results on the topic in the literature. We mainly follow the notions and notations of Azam et al.[1].

Let $\mathbb{C}$ be the set of all complex numbers,for $\mathrm{z}_{1}, \mathrm{z}_{2} \in \mathbb{C}$, define a partial order $\precsim$ on $\mathbb{C}$ as follows;
$\mathrm{z}_{1}$ $\mathrm{z}_{2}$ iff $\operatorname{Re}\left(\mathrm{z}_{1}\right) \leq \operatorname{Re}\left(\mathrm{z}_{2}\right), \operatorname{Im}\left(\mathrm{z}_{1}\right) \leq \operatorname{Im}\left(\mathrm{z}_{2}\right)$
it follows that
$\mathrm{z}_{1} \precsim \mathrm{z}_{2}$, if one of the following conditions is satisfied:
i. $\quad \operatorname{Re}\left(z_{1}\right)=\operatorname{Re}\left(z_{2}\right), \operatorname{Im}\left(z_{1}\right)<\operatorname{Im}\left(z_{2}\right)$

# International Journal of Innovative Research in Science, Engineering and Technology 

(An ISO 3297: 2007 Certified Organization)

Vol. 5, I ssue 6, June 2016
ii. $\quad \operatorname{Re}\left(\mathrm{z}_{1}\right)<\operatorname{Re}\left(\mathrm{z}_{2}\right), \operatorname{Im}\left(\mathrm{z}_{1}\right)=\operatorname{Im}\left(\mathrm{z}_{2}\right)$
iii. $\operatorname{Re}\left(\mathrm{z}_{1}\right)<\operatorname{Re}\left(\mathrm{z}_{2}\right), \operatorname{Im}\left(\mathrm{z}_{1}\right)<\operatorname{Im}\left(\mathrm{z}_{2}\right)$
iv. $\quad \operatorname{Re}\left(z_{1}\right)=\operatorname{Re}\left(z_{2}\right), \operatorname{Im}\left(z_{1}\right)=\operatorname{Im}\left(z_{2}\right)$

In particular, we will write $\mathrm{z}_{1} \preccurlyeq \mathrm{z}_{2}$ if $\mathrm{z}_{1} \neq \mathrm{z}_{2}$ and one the (i), (ii), (iii) conditions is satisfied and we will write $\mathrm{z}_{1}<\mathrm{z}_{2}$. Note that
$0 \precsim \mathrm{z}_{1} \subsetneq \mathrm{z}_{2} \Rightarrow\left|\mathrm{z}_{1}\right|<\left|\mathrm{z}_{2}\right|$,
$\mathrm{z}_{1}$ § $\mathrm{z}_{2}, \mathrm{z}_{2}<\mathrm{z}_{3} \Rightarrow \mathrm{z}_{1} \prec \mathrm{z}_{3}$

Definition 1.2.[1]Let X be a nonempty set. A mapping d: $\mathrm{X} \times \mathrm{X} \rightarrow \mathbb{C}$ is called a complex valued metric on X if the following conditions are satisfied:
(1.1) $0 \precsim d(x, y)$ for all $x, y \in X$ and $d(x, y)=0 \Leftrightarrow x=y$.
(1.2) $d(x, y)=d(y, x)$ for all $x, y \in X$
(1.3) $\mathrm{d}(\mathrm{x}, \mathrm{y}) \precsim \mathrm{d}(\mathrm{x}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{y})$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$.

In this case, we say that $(\mathrm{X}, \mathrm{d})$ is a complex valued metric space.

Definition 1.3.[3]Let $\mathbb{C}$ be a complex valued metric space,

- We say that a sequence $\left\{x_{n}\right\}$ is said to be a Cauchy sequenceX, if for every $c \in \mathbb{C}$, with $0<c$ there is $n_{0} \in \mathbb{N}$ such that for all $\mathrm{n}>\mathrm{n}_{0}$ such thatd $\left(\mathrm{x}_{\mathrm{n}}, \mathrm{X}_{\mathrm{m}}\right)<\mathrm{c}$.
- We say that a sequence $\left\{x_{n}\right\}$ converges to an element $x \in X$. If for every $c \in \mathbb{C}$, with $0<c$ ther exist an integer $\mathrm{n}_{0} \in \mathbb{N}$ such that for all $\mathrm{n}>\mathrm{n}_{0}$ such that $\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}\right)<\mathrm{c}$ and we write $\mathrm{x}_{\mathrm{n}} \rightarrow \mathrm{x}$.
- We say that $(\mathrm{X}, \mathrm{d})$ is complete if every Cauchy sequence in X converges to a point in X .

Lemma 1.4.[3]Any sequence $\left\{x_{n}\right\}$ in complex valued metric space ( $X, d$ ), converges to $x$ if and only if $\left|d\left(x_{n}, x\right)\right| \rightarrow 0$ as $n \rightarrow \infty$

Lemma 1.5.[3]Any sequence $\left\{x_{n}\right\}$ in complex valued metric space ( $X, d$ ) is a Cauchy sequence if and only if $\left|\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+\mathrm{m}}\right)\right| \rightarrow 0$ as $\mathrm{n} \rightarrow \infty$, where $\mathrm{m} \in \mathbb{N}$

Definition 1.6.[9] Let $S$ and $T$ be self-maps of metric space ( $X, d$ ), then $S, T$ are said to be weakly commuting if $d(S T x, T S x) \leq d(S x, T x)$, for all $x \in X$

Definition 1.7.[4] Two self-maps $S, T$ of a non-empty set $X$ are said to be weakly compatible is $S T x=T S x$ whenever Sx=Tx.

## II. MAIN RESULTS

In this section, we prove some common fixed point theorems for rational type contraction conditions. Our main result runs as follows

Theorem 2.1.Let ( $\mathrm{X}, \mathrm{d}$ ) be acomplete complex valued metric space and $P, Q, R, S, T, U$ be self-maps of $X$ satisfying the following condition
(2.1) $\mathrm{TU}(\mathrm{X}) \subseteq \mathrm{P}(\mathrm{X})$ and $\mathrm{RS}(\mathrm{X}) \subseteq \mathrm{Q}(\mathrm{X})$ and
(2.2) $\mathrm{d}(\mathrm{RSx}, \mathrm{TUy}) \precsim\binom{\mathrm{ad}(\mathrm{Px}, \mathrm{Qy}) \frac{[\mathrm{d}(\mathrm{Px}, \mathrm{RSx})+\mathrm{d}(\mathrm{TUy}, \mathrm{Qy})]}{\mathrm{d}(\mathrm{RSx}, \mathrm{TUy})+\mathrm{d}(\mathrm{Qy}, \mathrm{Px})}+\mathrm{bd}(\mathrm{TUy}, \mathrm{RSx}) \frac{[\mathrm{d}(\mathrm{TUy}, \mathrm{Qy})+\mathrm{d}(\mathrm{Px}, \mathrm{RSx})]}{\mathrm{d}(\mathrm{Px}, \mathrm{Qy})+\mathrm{d}(\mathrm{TUy}, \mathrm{RSx})}}{+\mathrm{cd}(\mathrm{Qy}, \mathrm{RSx}) \frac{[\mathrm{d}(\mathrm{Px}, \mathrm{TUy})]}{\mathrm{d}(\mathrm{RSx}, \mathrm{TUy})+\mathrm{d}(\mathrm{RSx}, \mathrm{Px})}+\mathrm{ed}(\mathrm{Qy}, \mathrm{RSx}) \frac{[\mathrm{d}(\mathrm{TUy}, \mathrm{Px})]}{\mathrm{d}(\mathrm{Px}, \mathrm{Qy})+\mathrm{d}(\mathrm{TUy}, \mathrm{RSx})}}$
for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$ where $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{e} \geq 0$ and $\mathrm{a}+\mathrm{b}+\mathrm{c}+\mathrm{e}<1$. Assume that pairs (TU,Q), (RS,P) are weakly compatible, and the pairs $(T, U),(T, Q),(R, S),(R, P)$ and $(S, P)$ are commuting pairs of maps. Then $T, U, R, S, Q$ and $P$ have a unique common fixed point in X .

Proof:Let $x_{0} \in X$ by (2.1) we can define inductively a sequence $\left\{y_{n}\right\}$ in $X$ such that $y_{2 n}=R S x_{2 n}=Q x_{2 n+1}$ and $\mathrm{TUx}_{2 \mathrm{n}+1}=\operatorname{Px}_{2 \mathrm{n}+2}=\mathrm{y}_{2 \mathrm{n}+1}$ for all $\mathrm{n}=0,1,2,3 \ldots$

> By (2.2), we have
$d\left(y_{2 n}, y_{2 n+1}\right)=d\left(\operatorname{RSx}_{2 n}, T U x_{2 n+1}\right)$

$$
\begin{aligned}
& \lesssim\left(\begin{array}{c}
\quad \operatorname{ad}\left(y_{2 n-1}, y_{2 n}\right) \frac{\left[d\left(y_{2 n-1}, y_{2 n}\right)+d\left(y_{2 n+1}, y_{2 n}\right)\right]}{d\left(y_{2 n}, y_{2 n+1}\right)+d\left(y_{2 n}, y_{2 n-1}\right)} \\
+\quad \operatorname{bd}\left(y_{2 n+1}, y_{2 n}\right) \frac{\left[d\left(y_{2 n+1}, y_{2 n}\right)+d\left(y_{2 n-1}, y_{2 n}\right)\right]}{d\left(y_{2 n-1}, y_{2 n}\right)+d\left(y_{2 n+1}, y_{2 n}\right)} \\
+\operatorname{cd}\left(y_{2 n}, y_{2 n}\right) \frac{\left[d\left(y_{2 n-1}, y_{2 n+1}\right)\right]}{d\left(y_{2 n}, y_{2 n+1}\right)+d\left(y_{2 n}, y_{2 n-1}\right)} \\
+\operatorname{ed}\left(y_{2 n}, y_{2 n}\right) \cdot \frac{\left[d\left(y_{2 n+1}, y_{2 n-1}\right)\right]}{d\left(y_{2 n-1}, y_{2 n}\right)+d\left(y_{2 n+1}, y_{2 n}\right)}
\end{array}\right) \\
& \mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right) \precsim \mathrm{ad}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}\right)+\operatorname{bd}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right) \\
& (1-\mathrm{b}) \mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right) \precsim \operatorname{ad}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}\right)
\end{aligned}
$$

Therefore,

$$
\begin{equation*}
\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right) \precsim \frac{\mathrm{a}}{1-\mathrm{b}} \mathrm{~d}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}\right) \tag{2.3}
\end{equation*}
$$

## International Journal of Innovative Research in Science, Engineering and Technology

## (An ISO 3297: 2007 Certified Organization)

Vol. 5, Issue 6, June 2016
Similarly we have,

$$
\begin{aligned}
& \mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)=\mathrm{d}\left(\mathrm{TUx}_{2 \mathrm{n}+1}, \mathrm{RSx}_{2 \mathrm{n}+2}\right) \\
& =\mathrm{d}\left(\mathrm{RSx}_{2 \mathrm{n}+2}, \mathrm{TUx}_{2 \mathrm{n}+1}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \lesssim\left(\begin{array}{c}
\operatorname{ad}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right) \frac{\left[\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right)\right]}{\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+2}, \mathrm{y}_{2 \mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right)} \\
+\operatorname{bd}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right) \frac{\left[\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)\right]}{\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)} \\
+\operatorname{cd}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+2}\right) \frac{\left[\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+1}\right)\right]}{\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+2}, \mathrm{y}_{2 \mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+2}, \mathrm{y}_{2 \mathrm{n}+1}\right)} \\
+\operatorname{ed}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+2}\right) \cdot \frac{\left[d\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+1}\right)\right]}{\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right)+\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)}
\end{array}\right) \\
& \mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right) \precsim \operatorname{ad}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}\right)+\operatorname{bd}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right)
\end{aligned}
$$

Therefore

$$
\text { (2.4) } \mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+2}\right) \precsim \frac{\mathrm{a}}{1-\mathrm{b}} \mathrm{~d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right)
$$

(2.5) $\mathrm{d}\left(\mathrm{y}_{2 \mathrm{n}}, \mathrm{y}_{2 \mathrm{n}+1}\right) \precsim \mathrm{kd}\left(\mathrm{y}_{2 \mathrm{n}-1}, \mathrm{y}_{2 \mathrm{n}}\right)$, where $\mathrm{k}=\frac{\mathrm{a}}{1-\mathrm{b}}$

Using (2.3), (2.4) and (2.5), we have

$$
\begin{aligned}
\mathrm{d}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}\right) & \lesssim \mathrm{kd}\left(\mathrm{y}_{\mathrm{n}-1}, \mathrm{y}_{\mathrm{n}}\right) \\
& \lesssim \mathrm{k}^{2} \mathrm{~d}\left(\mathrm{y}_{\mathrm{n}-2}, \mathrm{y}_{\mathrm{n}-1}\right)
\end{aligned}
$$

$\mathrm{k}^{\mathrm{n}} \mathrm{d}\left(\mathrm{y}_{0}, \mathrm{y}_{1}\right)$ for all n .
(2.6) $\mathrm{d}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}+1}\right) \precsim \mathrm{k}^{\mathrm{n}} \mathrm{d}\left(\mathrm{y}_{0}, \mathrm{y}_{1}\right)$ for all n .
therefore,
$d\left(y_{n}, y_{m}\right) \precsim d\left(y_{n}, y_{n+1}\right)+d\left(y_{n+1}, y_{n+2}\right)+\ldots+d\left(y_{m-1}, y_{m}\right)$
ふ $\left.\mathrm{k}^{\mathrm{n}}+\mathrm{k}^{\mathrm{n}+1}+\ldots+\mathrm{k}^{\mathrm{m}-1}\right) \mathrm{d}\left(\mathrm{y}_{1}, \mathrm{y}_{0}\right)$
$\frac{\mathrm{k}^{\mathrm{n}}}{1-\mathrm{k}} \mathrm{d}\left(\mathrm{y}_{1}, \mathrm{y}_{0}\right), \quad \quad$ (using 2.6)
$\mathrm{d}\left(\mathrm{y}_{\mathrm{n}}, \mathrm{y}_{\mathrm{m}}\right) \preccurlyeq \frac{\mathrm{k}^{\mathrm{n}}}{1-\mathrm{k}} \mathrm{d}\left(\mathrm{y}_{1}, \mathrm{y}_{0}\right)$

# International Journal of Innovative Research in Science, Engineering and Technology 

## (An ISO 3297: 2007 Certified Organization)

## Vol. 5, I ssue 6, June 2016

Which implies that, $d\left(y_{n}, y_{m}\right) \rightarrow 0$ as $(n, m \rightarrow \infty)$. Hence $\left\{y_{n}\right\}$ is a Cauchy sequence, by the completeness of $X$, there exist $z \in X$ such that,

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \mathrm{RSx}_{2 \mathrm{n}}=\lim _{\mathrm{n} \rightarrow \infty} \mathrm{Qx}_{2 \mathrm{n}+1}=\lim _{\mathrm{n} \rightarrow \infty} \mathrm{TUx}_{2 \mathrm{n}+1}=\lim _{\mathrm{n} \rightarrow \infty} \mathrm{Px}_{2 \mathrm{n}+2}=\mathrm{z} \tag{2.7}
\end{equation*}
$$

Since, $\mathrm{TU}(\mathrm{X}) \subseteq \mathrm{P}(\mathrm{X})$ there exist $\mathrm{u} \in \mathrm{X}$ such that $\mathrm{z}=\mathrm{Pu}$,
We claim that $\mathrm{RSu}=\mathrm{z}$, if possible $\mathrm{RS} u \neq \mathrm{z}$, then by using (2.2), we have $\mathrm{d}(\mathrm{RSu}, \mathrm{z})=\mathrm{d}\left(\mathrm{RSu}_{,}, \mathrm{TUx}_{2 \mathrm{n}-1}\right)+\mathrm{d}\left(\mathrm{TUx}_{2 \mathrm{n}-1}, \mathrm{z}\right)$

$$
\begin{aligned}
& \mathrm{d}(\mathrm{RSu}, \mathrm{z}) \precsim\binom{\mathrm{ad}(\mathrm{z}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{RSu})+\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{z})}+\mathrm{bd}(\mathrm{z}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{RSu})]}{\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{RSu})}+}{\mathrm{cd}(\mathrm{z}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{z})+\mathrm{d}(\mathrm{RSu}, \mathrm{z})}+\mathrm{ed}(\mathrm{z}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{RSu})}}+\mathrm{d}(\mathrm{z}, \mathrm{z})[\operatorname{using}(2.7)]
\end{aligned}
$$

taking the limit as $n \rightarrow \infty$, we have
$\mathrm{d}(\mathrm{RSu}, \mathrm{z}) \precsim \mathrm{bd}(\mathrm{z}, \mathrm{RSu})$, which is a contradiction.Therefore,
(2.8) $\quad \mathrm{RSu}=\mathrm{Pu}=\mathrm{z}$

Since, $R S(X) \subseteq Q(X)$ there exist $v \in X$ such that $z=Q v$.
We claim that $T U v=z$, if possible $T U v \neq z$, then by (2.2) and (2.8), we have $\mathrm{d}(\mathrm{z}, \mathrm{TUv})=\mathrm{d}(\mathrm{RSu}, \mathrm{TUv})$

$$
\begin{gathered}
\curvearrowright\binom{\mathrm{ad}(\mathrm{Pu}, \mathrm{Qv}) \frac{[\mathrm{d}(\mathrm{Pu}, \mathrm{RSu})+\mathrm{d}(\mathrm{TUv}, \mathrm{Qv})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{TUv})+\mathrm{d}(\mathrm{Qv}, \mathrm{Pu})}+\mathrm{bd}(\mathrm{TUv}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{TUv}, \mathrm{Qv})+\mathrm{d}(\mathrm{Pu}, \mathrm{RSu})]}{\mathrm{d}(\mathrm{Pu}, \mathrm{Qv})+\mathrm{d}(\mathrm{TUv}, \mathrm{RSu})}}{+\mathrm{cd}(\mathrm{Qv}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{Pu}, \mathrm{TUv})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{TUv})+\mathrm{d}(\mathrm{RSu}, \mathrm{Pu})}+\mathrm{ed}(\mathrm{Qv}, \mathrm{RSu}) \frac{[\mathrm{T}(\mathrm{TUv}, \mathrm{Pu})]}{\mathrm{d}(\mathrm{Pu}, \mathrm{Qv})+\mathrm{d}(\mathrm{TUv}, \mathrm{RSu})}} \\
\lesssim\binom{\mathrm{ad}(\mathrm{z}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{TUv}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{TUv})+\mathrm{d}(\mathrm{z}, \mathrm{z})}+\mathrm{bd}(\mathrm{TUv}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{TUv}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{TUv}, \mathrm{z})}}{+\mathrm{cd}(\mathrm{z}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{TUv}]}{\mathrm{d}(\mathrm{z}, \mathrm{TUv})+\mathrm{d}(\mathrm{z}, \mathrm{z})}+\operatorname{ed}(\mathrm{z}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{TUv}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{TUv}, \mathrm{z})}}[\mathrm{using}(2.8)]
\end{gathered}
$$

$\mathrm{d}(\mathrm{z}, \mathrm{TUv})$ $(\mathrm{bd}(\mathrm{TUv}, \mathrm{z}))$
$\mathrm{d}(\mathrm{z}, \mathrm{TUv}) \precsim \mathrm{bd}(\mathrm{TUv}, \mathrm{z})$, which is a contradiction.
therefore, $\mathrm{TUv}=\mathrm{Qv}=\mathrm{z}$ so,
(2.9) $\mathrm{Pu}=\mathrm{TUv}=\mathrm{Qv}=\mathrm{z}$

Similarly, Q and TU are weakly compatible maps, we have TUz=Qz.
Now we claim that z is a fixed point ofTU. If $\mathrm{TU} \mathrm{z} \neq \mathrm{z}$, then by (2.2), we have
$\mathrm{d}(\mathrm{z}, \mathrm{TUz})=\mathrm{d}(\mathrm{RSu}, \mathrm{TUz})$

# International Journal of Innovative Research in Science, Engineering and Technology 

(An ISO 3297: 2007 Certified Organization)

## Vol. 5, Issue 6, June 2016

$$
\lesssim\binom{\mathrm{ad}(\mathrm{Pu}, \mathrm{Qz}) \frac{[\mathrm{d}(\mathrm{Pu}, \mathrm{RSu})+\mathrm{d}(\mathrm{TUz}, \mathrm{Qz})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{TUz})+\mathrm{d}(\mathrm{Qz}, \mathrm{Pu})}+\mathrm{bd}(\mathrm{TUz}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{Qz})+\mathrm{d}(\mathrm{Pu}, \mathrm{RSu})]}{\mathrm{d}(\mathrm{Pu}, \mathrm{Qz})+\mathrm{d}(\mathrm{TUz}, \mathrm{RSu})}}{+\mathrm{cd}(\mathrm{Qz}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{Pu}, \mathrm{TUz})]}{\mathrm{d}(\mathrm{RSu}, \mathrm{TUz})+\mathrm{d}(\mathrm{RSu}, \mathrm{Pu})}+\mathrm{ed}(\mathrm{Qz}, \mathrm{RSu}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{Pu})]}{\mathrm{d}(\mathrm{Pu}, \mathrm{Qz})+\mathrm{d}(\mathrm{TUz}, \mathrm{RSu})}}
$$

$\mathrm{d}(\mathrm{z}, \mathrm{TUz}) \precsim\binom{\mathrm{ad}(\mathrm{z}, \mathrm{TUz}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{TUz}, \mathrm{TUz})]}{\mathrm{d}(\mathrm{z}, \mathrm{TUz})+\mathrm{d}(\mathrm{TUz}, \mathrm{z})}+\mathrm{bd}(\mathrm{TUz}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{TUz})+\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{TUz})+\mathrm{d}(\mathrm{TUz}, \mathrm{z})}}{.\mathrm{cd}(\mathrm{TUz}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{TUz})]}{\mathrm{d}(\mathrm{z}, \mathrm{TUz})+\mathrm{d}(\mathrm{z}, \mathrm{z})}+\mathrm{ed}(\mathrm{TUz}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{TUz})+\mathrm{d}(\mathrm{TUz}, \mathrm{z})}}$ [using (2.8)]

$$
\mathrm{d}(\mathrm{z}, \mathrm{TUz}) \precsim \mathrm{cd}(\mathrm{TUz}, \mathrm{z})+\frac{\mathrm{e}}{2} \mathrm{~d}(\mathrm{TUz}, \mathrm{z})
$$

$\mathrm{d}(\mathrm{z}, \mathrm{TUz}) \precsim\left(\mathrm{c}+\frac{\mathrm{e}}{2}\right) \mathrm{d}(\mathrm{TUz}, \mathrm{z})$, which is a contradiction.
Therefore, $\mathrm{TUz=}=\mathrm{z}$, hence $\mathrm{Qz}=\mathrm{z}$. So, we have
(2.10) $\quad \mathrm{TUz=Qz=z}$.

Similarly, P and RS are weakly compatible maps, we have $\mathrm{RSz}=\mathrm{Pz}$.
Now we claim that z is a fixed point of RS . If $\mathrm{RSz} \neq z$, then by (2.2), we have
$\mathrm{d}(\mathrm{RSz}, \mathrm{z})=\mathrm{d}(\mathrm{RSz}, \mathrm{TUz})$

$$
ふ\binom{\mathrm{ad}(\mathrm{Pz}, \mathrm{Qz}) \frac{[\mathrm{d}(\mathrm{Pz}, \mathrm{RSz})+\mathrm{d}(\mathrm{TUz}, \mathrm{Qz})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{TUz})+\mathrm{d}(\mathrm{Qz}, \mathrm{Pz})}+\mathrm{bd}(\mathrm{TUz}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{Qz})+\mathrm{d}(\mathrm{Pz}, \mathrm{RSz})]}{\mathrm{d}(\mathrm{Pz}, \mathrm{Qz})+\mathrm{d}(\mathrm{TUz}, \mathrm{RSz})}}{+\mathrm{cd}(\mathrm{Qz}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{Pz}, \mathrm{TUz})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{TUz})+\mathrm{d}(\mathrm{RSz}, \mathrm{Pz})}+\mathrm{ed}(\mathrm{Qz}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{TUz}, \mathrm{Pz})]}{\mathrm{d}(\mathrm{Pz}, \mathrm{Qz})+\mathrm{d}(\mathrm{TUz}, \mathrm{RSz})}}
$$

we have,
$\mathrm{d}(\mathrm{RSz}, \mathrm{z}) \precsim\binom{\operatorname{ad}(\mathrm{RSz}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{RSz}, \mathrm{RSz})+\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{z})+\mathrm{d}(\mathrm{zRzz})}+\mathrm{bd}(\mathrm{RSz}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{RSz}, \mathrm{RSz})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{RSz})}}{+\mathrm{cd}(\mathrm{z}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{RSz}, \mathrm{z})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{z})+\mathrm{d}(\mathrm{RSz}, \mathrm{RSz})}+\operatorname{ed}(\mathrm{z}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{RSz})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{z})+\mathrm{d}(\mathrm{z}, \mathrm{RSz})}}$

$$
\mathrm{d}(\mathrm{RSz}, \mathrm{z}) \precsim\left(\mathrm{cd}(\mathrm{z}, \mathrm{RSz})+\frac{\mathrm{e}}{2} \mathrm{~d}(\mathrm{z}, \mathrm{RSz})\right)
$$

$\mathrm{d}(\mathrm{RSz}, \mathrm{z}) \precsim\left(\mathrm{c}+\frac{\mathrm{e}}{2}\right) \mathrm{d}(\mathrm{z}, \mathrm{RSz})$, which is a contradiction.
Therefore, RSz=z. So, we have

$$
\begin{equation*}
\mathrm{RSz=Pz=z} . \tag{2.11}
\end{equation*}
$$

So, z is a common fixed point of TU, $\mathrm{Q}, \mathrm{P}$ and RS.
By commuting condition of pairs
$\mathrm{Tz}=\mathrm{T}(\mathrm{TUz})=\mathrm{T}(\mathrm{UTz})=\mathrm{TU}(\mathrm{Tz})$
$\mathrm{Tz}=\mathrm{T}(\mathrm{Pz})=\mathrm{P}(\mathrm{Tz})$ and $\mathrm{Uz}=\mathrm{U}(\mathrm{TUz})=(\mathrm{UT})(\mathrm{Uz})=(\mathrm{TU})(\mathrm{Uz})$
$\mathrm{Uz}=\mathrm{U}(\mathrm{Pz})=\mathrm{P}(\mathrm{Uz})$ which follows that, Tz and Uz are common fixed points of TU and P , Then
(2.12) $T z=z=U z=P z=T U z$

Similarly, By commuting property,
$\mathrm{Rz}=\mathrm{R}(\mathrm{RSz})=\mathrm{R}(\mathrm{SRz})=\mathrm{RS}(\mathrm{Rz})$

## Vol. 5, Issue 6, June 2016

$\mathrm{Rz}=\mathrm{R}(\mathrm{Qz})=\mathrm{Q}(\mathrm{Rz})$ and $\mathrm{Sz}=\mathrm{S}(\mathrm{RSz})=(\mathrm{SR})(\mathrm{Sz})=(\mathrm{RS})(\mathrm{Sz})$
$(\mathrm{Sz})=\mathrm{S}(\mathrm{Qz})=\mathrm{Q}(\mathrm{Sz})$ which follows that, Rzand Sz are common fixed points of RS and Q , Then
$\mathrm{Rz}=\mathrm{z}=\mathrm{Sz}=\mathrm{Qz}=\mathrm{RS} \mathrm{z}$
Therefore z is a common fixed point of $\mathrm{T}, \mathrm{U}, \mathrm{R}, \mathrm{S}, \mathrm{P}$ and Q .

## Uniqueness

Let $w$ be other common fixed point of T,U,R,P,S and Q . if possible $\mathrm{w} \neq z$. Then by (2.2), we have $\mathrm{d}(\mathrm{z}, \mathrm{w})=\mathrm{d}(\mathrm{RS} \mathrm{z}, \mathrm{TUw})$

$$
\begin{aligned}
& \qquad\binom{\mathrm{ad}(\mathrm{Pz}, \mathrm{Qw}) \frac{[\mathrm{d}(\mathrm{Pz}, \mathrm{RSz})+\mathrm{d}(\mathrm{TUw}, \mathrm{Qw})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{TUw})+\mathrm{d}(\mathrm{Qw}, \mathrm{Pz})}+\mathrm{bd}(\mathrm{TUw}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{TUw}, \mathrm{Qw})+\mathrm{d}(\mathrm{Pz}, \mathrm{RSz})]}{\mathrm{d}(\mathrm{Pz}, \mathrm{Qw})+\mathrm{d}(\mathrm{TUw}, \mathrm{RSz})}}{+\mathrm{cd}(\mathrm{Qw}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{Pz}, \mathrm{TUw})]}{\mathrm{d}(\mathrm{RSz}, \mathrm{TUw})+\mathrm{d}(\mathrm{RSz}, \mathrm{Pz})}+\mathrm{ed}(\mathrm{Qw}, \mathrm{RSz}) \frac{[\mathrm{d}(\mathrm{TUw}, \mathrm{Pz})]}{\mathrm{d}(\mathrm{Pz}, \mathrm{Qw})+\mathrm{d}(\mathrm{TUw}, \mathrm{RSz})}} \\
& =\binom{\mathrm{ad}(\mathrm{z}, \mathrm{w}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{z})+\mathrm{d}(\mathrm{w}, \mathrm{w})]}{\mathrm{d}(\mathrm{z}, \mathrm{w})+\mathrm{d}(\mathrm{w}, \mathrm{z})}+\mathrm{bd}(\mathrm{w}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{w}, \mathrm{w})+\mathrm{d}(\mathrm{z}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{w})+\mathrm{d}(\mathrm{w}, \mathrm{z})}}{+\mathrm{cd}(\mathrm{w}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{z}, \mathrm{w})]}{\mathrm{d}(\mathrm{z}, \mathrm{w})+\mathrm{d}(\mathrm{z}, \mathrm{z})}+\mathrm{ed}(\mathrm{w}, \mathrm{z}) \frac{[\mathrm{d}(\mathrm{w}, \mathrm{z})]}{\mathrm{d}(\mathrm{z}, \mathrm{w})+\mathrm{d}(\mathrm{w}, \mathrm{z})}} \\
& =\left(\mathrm{c}+\frac{\mathrm{e}}{2}\right) \mathrm{d}(\mathrm{w}, \mathrm{z}) \\
& \mathrm{d}(\mathrm{z}, \mathrm{w}) \precsim\left(\mathrm{c}+\frac{\mathrm{e}}{2}\right) \mathrm{d}(\mathrm{w}, \mathrm{z}), \text { a contradiction. }
\end{aligned}
$$

So,z=w.
Hence, T, U, R, S, Q and P have a unique common fixed point in X .

## BIOGRAPHY

Kamal Kumar is an assistant professor in Department of Mathematics at Pt. JLN Govt. P.G college, Faridabad, India. He has been teaching for 10 years. He has published 8 research papers in international journals. His research area includes fixed Point theory, analysis and Topology.

Nisha Sharma is an assistant professor in Department of Mathematics at Pt. JLN Govt. P.G college, Faridabad, India. She has been teaching for 2 years. She has published 10 research papers in international journals. Her research interest includes fixed Point theory, analysis and Topology.

Rajeev Jha is presently working in Department of mathematics, College of Engineering, TeerthankarUniverdsity, Maradabad, India. He has 19 years of experience in teaching and research. He has published 160 research papers in national/ International Journals and attended 50 national/International conferences in India and Abroad.

Ritu Sharma is an assistant professor in Department of Mathematics at Pt. JLN Govt. P.G college, Faridabad, India. She has been teaching for 5 years. Her research interest includes fixed Point theory and analysis.

Sheetal Joshi is presently working inAmity University, Noida. She has 7 years of experience in teaching and research. He has published 7 research papers in national/ International Journals.
