#### Abstract

In this paper we have proved some fixed point theorems of fuzzy function in complete metric spaces. The presented results generalize the results proved in various spaces and extend of Bose and Mukherjee's theorems of common fixed points of a pair of multivalued mappings and a sequence of single valued mappings.

In this paper we establish some fixed point theorems of fuzzy mapping in complete metric spaces.

## I. INTRODUCTION

Heilpern [8] introduced the concept of fuzzy mappings and proved fixed point theorem for fuzzy contraction mappings. Since then, many authors have generalized Bose and Sahanis results in different directions. Also Bose and Mukherjee (see [2], [3]) considered common fixed points of a pair of multivalued mappings and a sequence of single valued mappings. We present some theorems which are generalized to ordered metric space setting and generalizations of the main theorem of several authors

## II. PRELIMINARIES

## Definition 2.1.

Let (X, d) be a metric linear space and $\mathrm{F}(\mathrm{X})$, the collection of all fuzzy sets in X . Let $\mathrm{A} \epsilon \mathrm{F}(\mathrm{X})$ and $\alpha \in[0,1]$. The $\alpha$-level set of A, denoted by $A_{\alpha}$, and $A_{\alpha}=\{x: A(x) \geq \alpha\}$ if $\alpha \in(0,1], A_{0}=\overline{\{x: A(x)>0\}}$ where $\bar{A}$ stands for the (non fuzzy) closure of A.

## Definition 2.2.

A fuzzy subset A of X is an approximate quantity iff its $\sup _{x \in X} \mathrm{~A}(\mathrm{x})=1$. From the collection $\mathrm{F}(\mathrm{X})$, a sub collection of approximate quantities is denoted as $\mathrm{W}(\mathrm{X})$.

The distance between two approximate quantities is defined by the following scheme.
Let $\mathrm{A}, \mathrm{B} \in \mathrm{W}(\mathrm{X})$, and $\alpha \in[0,1]$;

$H_{\alpha}(\mathrm{A}, \mathrm{B})=\operatorname{dist}\left(A_{\alpha}, B_{\alpha}\right)$;
$\mathrm{H}(\mathrm{A}, \mathrm{B})=\sup _{a} D_{\alpha}(\mathrm{A}, \mathrm{B})$; Where in the dist is in the sense of Hausdorff distance.

Vol. 6, Issue 7, July 2017
The function $D_{\alpha}$ is called a $\alpha$-distance (induced by d),
$H_{\alpha}$ is called a a-distance (induced by dist), and H a distance between A and B .
Let $A, B \in W(X)$. An approximate quantity $A$ is more accurate than $B$, denoted by $A \subset B$ iff $A(x) \leq B(x)$, for each $x \in X$. It is clear that $\subset$ is a partial order relation determined on the family $W(X)$.

Let Y be an arbitrary set and X any metric linear space. F is called fuzzy mapping iff F is a mapping from the set $Y$ into $W(X)$, that is $F(y) \in W(X)$ for each $y \in Y$ and the function value $F(y, x)$ stands for the grade of membership of $x$ in $F(y)$.

Let $A \in F(Y), B \in F(X)$. Then the fuzzy set $F(A)$ in $F(X)$ is defined by
$\mathrm{F}(\mathrm{A})(\mathrm{x})=\sup _{y \epsilon \mathrm{Y}}\left(\mathrm{F}(\mathrm{y}, \mathrm{x})^{\wedge} \mathrm{A}(\mathrm{y})\right), \mathrm{x} \in \mathrm{X}$ and the fuzzy set $F^{-1}(\mathrm{~B})$ in $\mathrm{F}(\mathrm{Y})$ is defined by $F^{-1}(\mathrm{~B})(\mathrm{y})=\sup _{x \epsilon X}\left(\mathrm{~F}(\mathrm{y}, \mathrm{x})^{\wedge} \mathrm{B}(\mathrm{x})\right), \mathrm{y} \in \mathrm{Y}$

Lemma 2.1. [8]. Let $x \in X, A \in W(x)$ and $\{x\}$ a fuzzy set with membership function equal to a characteristic function of $\{x\}$. If $\{x\} \subset A$, then $\quad D_{\alpha}(\mathrm{x}, \mathrm{A})=0$ for each $\alpha \in[0,1]$.

Lemma 2.2. [8]: $\quad D_{\alpha}(\mathrm{x}, \mathrm{A}) \leq d(x, y)+D_{\alpha}(\mathrm{y}, \mathrm{A})$ for each $\mathrm{x}, \mathrm{y} \in \mathrm{X}$.
Lemma2.3.[8]:If $\left\{x_{0}\right\} \subset \mathrm{A}$, then $D_{\alpha}\left(x_{0}, \mathrm{~B}\right) \leq H_{\alpha}(\mathrm{A}, \mathrm{B})$ for each $\mathrm{B} \in \mathrm{W}(\mathrm{x})$.

## III. MAIN RESULTS

Theorem 3.1.Let X be a complete metric linear space and T be fuzzy mapping from X to $\mathrm{W}(\mathrm{x})$ satisfying

$$
\mathrm{H}(\mathrm{~T}(\mathrm{x}), \mathrm{T}(\mathrm{y}))+\mathrm{k}\left[D_{\alpha}(\mathrm{x}, \mathrm{~T}(\mathrm{x}))+D_{\alpha}(\mathrm{y}, \mathrm{~T}(\mathrm{y}))\right] \leq \mathrm{a} D_{\alpha}(\mathrm{x}, \mathrm{~T}(\mathrm{y}))+\mathrm{b} D_{\alpha}(\mathrm{y}, \mathrm{~T}(\mathrm{x}))+2 \mathrm{~cd}(\mathrm{x}, \mathrm{y}) \text {.for all } \mathrm{x}, \mathrm{y} \in \mathrm{C} \text {; where }
$$ $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{k} \geq 0$ and $2 \mathrm{~b}+2 \mathrm{c}<1+2 \mathrm{k}, \mathrm{a}+\mathrm{b}+\mathrm{c}<1$ and $1+\mathrm{k}>\mathrm{b}$. Then there exists a point $\mathrm{z} \in \mathrm{X}$ such that $\{\mathrm{z}\} \subset \mathrm{T}(\mathrm{z})$.

## Proof.

Take $x_{0} \in \mathrm{X}$. Let $\left\{x_{1}\right\} \subset \mathrm{T}\left(x_{0}\right)$, choose $x_{2}$ such that $\left\{x_{2}\right\} \subset \mathrm{T}\left(x_{1}\right)$, and
$\mathrm{d}\left(x_{1}, x_{2}\right) \leq H_{1}\left(\mathrm{~T}\left(x_{0}\right), T\left(x_{1}\right)\right)$.
Continuing this process we construct a sequence $\left\{x_{n}\right\}$ such that $\left\{x_{n+1}\right\} \subset \mathrm{T}\left(x_{n}\right)$ and

Hence $\mathrm{z} \subset \mathrm{T}(\mathrm{z})$

## IV. CONCLUSION

We have proved some fixed point theorems of fuzzy function in complete metric spaces. The presented results generalize the results proved in various spaces and extend some results from the literature.
