Changes in the Information Communication System are a Means of Integrating Different Ideas Into the Minds of Young People

Tashmetov Tuxtasin Xudoyberganovich

Tashkent region Chirchiq State Pedagogical Institute, Teacher of the Department "Social Sciences", Uzbekistan

ANNOTATION: Since information has become a powerful weapon in Global change, the information communication system serves as the main factor in the promotion and promotion of ideological and ideological threats on a global scale. With the help of the information communication system, special attention is paid to the influence on the soul, consciousness and psyche of people. Therefore, we should not ignore the escalation of various ideological, ideological and information attacks. And such risks, which threaten the peace and stability of the country, are not eliminated by themselves. To do this, it is necessary to distinguish the information obtained by the information communication system in young people, to form literacy, to protect young people from global information attacks, to rely on our national values, to widely promote the reading of artistic works that praise our national identity, to study our spiritual heritage, to establish moral education that is characteristic of our nation, Only then, in the future, we will achieve the upbringing of a spiritually harmonious person, a healthy generation.

KEYWORDS: Information, internet, communication, global, spirituality, information attack, religious-extremism, "mass culture", democracy, threat, idea, ideology, distance learning, technology.

It is known that the 21st century is the era of the destruction of the world and borders, the age of information and communication technologies and the internet, is becoming a century of increasing competition in the world arena and the world market. President Of The Republic Of Uzbekistan As Mirziyoyev noted, "the wide application of Information Communication Systems, the organization of Public Administration in electronic form, which is good, of course, in turn requires life itself to take additional measures connected with the provision of Information Security"[1]. in this regard, it is necessary to ensure that the information security system is fully operational. In fact, the prestige geopolitical position in any world community is determined by the level of development of modern computer technologies, including telecommunication systems and networks, the methods and opportunities for access to the world's information space. Therefore, huge changes are taking place in the media under the influence of global changes. Thanks to modern scientific and technical developments, they have reached a qualitatively new level, their effectiveness has increased. And the connection of the mass media to the world Information Network has greatly increased their chances of influencing the psyche of millions of people. With the help of the mass media, it became possible to direct social thought to the necessary self, create the necessary psychological conditions for the approval of certain political decisions. By the way, technical changes in the sphere of communications can also lead to social weakening of society. Negaki began to undermine social relations, social communication, which they formed over the centuries. As a result, the spiritual image of a person has radically changed.

Today, for the purpose of the development of Information Technology, large funds are being allocated by some states. German researcher L.Nefedov said: "today, one - third of the funds invested in research and development are being channeled into Information Technology"[2], he said. In fact, now information has become a powerful tool for ideological influence. Most ideological centers use information attacks in achieving their mercenary goals. In an atmosphere of globalism and the formation of a new international order of information, the words "whoever owns information, he owns the World"[3], pronounced almost four centuries ago by the famous English philosopher Francis Bacon, have new meaning.

As long as information becomes a powerful weapon in Global change, information serves as the main weapon in the promotion and propaganda of ideological and ideological threats around the world. Today, with the help of Information, special attention is paid to the influence on the soul, consciousness and psyche of people. As a result of this, there is an opportunity to ideologically and politically impress by influencing the consciousness of a person, his behavior and activity.

Today, in the era of global changes, as a result of the acceleration and intensification of information flow, universal processes related to spatial technologies have accelerated and the sphere of influence has expanded further. As a result, unprecedented scientific discoveries, global technologies and information dissemination have a serious impact on the ideological processes taking place in the world.

The acceleration of global processes is accompanied by an increase in the status of Information, Telecommunications in the life of society and a number of other factors. The specific subtleties of globalism are that it will be able to influence both positively and negatively. That is, on the one hand, all mankind will enjoy the achievements of the science that is being created. On the second hand, ideological aggression and information attacks create an opportunity to spread wide reach.

With the development of science achievements, the entry of information and communication technology tools into the educational process, the educational system also entered a new stage of distance learning. As a result, individual-oriented peer-to-peer internet in distance learning significantly increases the educational level of the learning process, relying on the excellent opportunities it offers.

As a definition to distance education - this is the type of education that is fodalán from information technology, because the teacher and the student are separated by distance or time with each other. There are several models of this type of education, they differ in their situation, which led to the organization of distance education: geographical reasons (the area of the country, the presence of geographically distant regions from the Centers), the level of computerization and informatization of the country, the level of development of transport and communications, the presence of specialists for distance education, the level

There are a number of advantages and disadvantages of applying distance learning, including:

- Education time is optional, the student can participate in the educational process, study, study when he / she is eligible;
- Do not need to pass training in the auditorium;
- Teaches students to engage independently;
- Requires high training from teachers;
- Students can acquire practical and qualitative knowledge;
- Develops students' independent thinking and decision-making skills;
- Students develop skills with technical devices, using computer, Internet, e-mail systems;
- The location to go to training ' cheap. Especially in low-income families, new conditions arise for young people to acquire knowledge;
- If he has little time to study or is far from his place of residence, he can get an education without leaving work at a convenient time for himself;
- Getting an education does not choose a limit, IE students can get knowledge without standing in another place - the province.

In the process of MT, the following training data can be used: manual (general course), audio and video data, electronic and multimedia manuals, electronic posters, on-line courses.

In addition, the online lesson system has also been slowly launched. Establish virtual communication with the student in different regions of our country through the Zoom program. This new educational system has several self-sufficient facilities. For example, the absence of a distance. That is, you will not go in any way to attend the lesson, you will not lose any time and will not waste your energy. Var focus will only be on the lesson. And the absence of expenses for transportation is another great convenience. But there is also the second side of the coin, of course. In the process of distance learning, it becomes a bit more difficult to create a competitive environment that will arise in the audience and classrooms. This leads to a decrease in the quality of education, albeit a little. Secondly, insecurity in electronic learning and communication processes. It is for this reason that students want to study mainly in ordinary (day-to-day and correspondence) types of education, and not in the type of education in the virtual state.

So gradually, this system also begins to find its development, of course. We hope that the errors and shortcomings will be eliminated and the level of education indicators will rise even higher. After all, distance learning is a bug's era requirement

A number of today's young people are gaining access to various information through the media, especially the internet, some of which are also analyzed by themselves, while the negative consequences of which are not deeply understood. As a result, the yacht remains tied to ideas. And such cases significantly affect the morale of young people.

The neglect of some young people to our national values leads to the fact that they become victims of various types of violence, violation of their dignity. And in such processes, the criteria of social justice in society are violated, relations that contradict the norms of morality prevail. As a result, conditions are created for the penetration of various ideologies that lie in the development of society.

Global changes, information attacks are the cause of a mental attack on human consciousness in the system "Society-nature". Today, in the international arena, various political forces are trying to ideologically influence the consciousness, soul and inner world of young people in order to realize their interests and goals.

Consequently, life is still white-it does not know the black well, social networks in the internet system for young people with low life experience and for future generations have become a source of moral threats. Social networks have created many spiritual threats that harm the future perfection of our youth. Of them:

- As a result of the increasing number of illegal flows using the social network of the internet system to mask our sacred religion and achieve their own merciless goals, our young people are joining them knowingly and unknowingly.
- As a result of the increasing number of indecent and pornographic materials threatening the culture, spirituality and enlightenment of the Uzbek people on various dating pages and social networks, it is forgotten that the family is a sacred place in the eyes of our youth.
- * The propagandists of "mass culture" are taking advantage of the opportunities of the social network of the internet system, achieving their own inhuman goals.

In a situation where the processes of formation of a restored democratic state and civil society in our country are successfully going on, it is also wrong to limit the access of young people to certain information, or to establish a strict border. However, it is necessary to understand them on the basis of concrete, vital examples of "mass culture" and its negative consequences, which do not correspond to our national interests. However, in addition to the negative impact on the worldview and spirituality of young people, "mass culture" poses an ideological threat to them. Mass culture is causing many young people around the world to unconsciously enter the "world" into the virtual world. In other words, the internet is turning into dependence.

We must avoid being subject to the samples of "mass culture", which today attracts young people to themselves, various music shows, clips, dirt films, TV shows in a new direction, as well as entertainment games organized in a number of internet clubs and others. It is also necessary to carry out irreplaceable work, such as protecting young people from global information attacks, relying on our national values, widely promoting the reading of artistic works that praise our national identity, studying our spiritual heritage, establishing moral education that is characteristic of our nation, further raising the morale of young people.

Today, the liberalization of governance in Uzbekistan requires new approaches to the development of Mass Communications in the processes of modernization of the state and society. Because the development of the same mass media communications before the state and society has the power to bring out huge opportunities as the main pillar of political-ideological, spiritual-spiritual communication. This is one side of the issue.

On the second side, we would like to emphasize that the current majority of studies devoted to the problem of mass media communication and youth are reflected in the connection with the mental health of the youth and its national-mental potential. In the period of Global changes, the strategic future of any independent state, its security and political stability are more determined within the framework of these issues. It is no accident. Already, the prospect of a nation is manifested in the worldview of young people who understand and understand the same global violence. Strictly speaking, it is clear that the socio-scientific environment, which is formed through mass media communications, is also directly influenced by these processes.

Other than the third today, the transformation of the image of national psychology and contemplation by other forces is becoming a global threat level. Spiritual and cultural problems in the information space are not abstract theoretical, but rather a far-sighted geopolitical essence. Gradually, the scale of Information Technology aggression, which is able to manage the masses, goes from the core of the spiritual world of civilizations, from the hollow to the realization.

From the four, it is desirable to strengthen the above qualities and become a criterion of vital activity by ensuring the harmony of such directions as geopolitics and media in the higher and secondary special education system. Educational work is carried out in the right way in young people, conducting purposeful struggle in their activities, accepting independent thought, confidence in their own power, active in reforms, preserving customs, traditions, respecting democracy, loyalty to noble ideas, being able to put Enlightenment against foreign ideas, showing awareness, creativity, spiritual heights, actively participating in community organizations, fighting ideological threats, exposing negative aspects of globalism, maintaining, the virtues of exposing the essence of democracy are manifested[4].

In this regard, the internet network attracts terrorist organizations with its speed, cost-effectiveness and openness, the slowness or lack of control, the presence of users spread around the world, the full dissemination of information in a quick and inexpensive way, the possibility of the establishment of peer groups, the anonymity of contacts, the impossibility of identifying the original source, the possibility of illegal At the same time, it can be separately acknowledged that virtual communication remains a source of harm to the present, especially to young people. "Even a small message, directed against human spirituality today, which seems insignificant at first glance, can take power from the violence of globalism in the information world and cause enormous harm, invisible to the eye, but not compensated for by anything"[5]. Indeed, the actual problems that arise in the sphere of spirituality, the preservation and promotion of the spirituality of our people, especially the preservation and protection of the heart, consciousness and inner world of the younger generation from the influence of various harmful ideas and ideologies, are a requirement of the period. The progressive achievements of science, modern information and communication technologies, in particular, the internet system, which is a high and bright manifestation of human thinking, are at the same time revealing the boundaries between different countries and regions, the merciless intentions of some political forces also serve as ideological weapons, and from this it is an important task to preserve the consciousness, spiritual In this regard, the role of spirituality, which serves the interests of the people and the vatan, which is decisive in the fate of the country and nation at all times in the history of mankind, and which combines Great Goals, is invaluable, which embodies the high qualities of mankind[6]. However, with a sense of national pride, which gives power to our past and future, we must educate new generations and strengthen our national statehood. In this process, the life experience itself proves that the issue of further improvement of the infrastructure and technology of integrating national and universal values into the consciousness, soul and inner world of the younger generation is an important factor in eliminating harmful and alien ideas, ideological threats.

In conclusion, it should be said that in the period of global changes, one of the factors in the effective fight against Information threats, the formation of Information Culture in young people, the acquisition of new technologies in the country and its wide introduction into all spheres is of urgent importance. Consequently, the foundation for progress is created by protecting the spiritual and spiritual world of young people from harmful elements, various destructive, alien and harmful ideas. After all, the upbringing of a higher generation of moral perfection and potential manifests itself not only in Uzbekistan, but also in the world as one of the most important tasks. Exactly the spiritual harmonious generation determines the next day of the country. Spiritual perfection is an important factor in the development of society.
