# An Application of Fractional Integral Operator Involving Extended Mittag-Leffler Function as Its Kernel

**R.N. Yadava<sup>1</sup>, Haresh Khodankar<sup>2</sup>**

Supervisor, Department of Mathematics, Madhyanchal Professional University, Bhopal (M.P.) , India<sup>1</sup>

Research Scholar, Department of Mathematics, Madhyanchal Professional University, Bhopal (M.P.) , India<sup>2</sup>

**ABSTRACT:** This paper is devoted to the study of fractional calculus with an integral and differential operators containing the following family of extended Mittag–Leffler function:

$$E_{\alpha,\beta}^{\gamma,\delta;c,d}(z; p, q) = \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma)}{B_p(\gamma, c - \gamma)} \frac{B_q(\delta + n, d - \delta)}{B_q(\delta, d - \delta)} \frac{(c)_n (d)_n}{\Gamma(\alpha n + \beta)} \frac{z^n}{n!}$$

in its kernel. Also, we further introduce a certain number of consequences of fractional integral and differential operators containing the said function in their kernels.

**KEYWORDS:** Fractional integral operator , Fractional differential operator , Mittag–Leffler function , Lebesgue measurable function, Extended Mittag–Leffler function.

## I. INTRODUCTION

The Mittag–Leffler functions appear in special functions as a solution of fractional order integral and differential equations. Some interesting applications of the Mittag–Leffler function are considered as follows: studied of kinetic equation, the telegraph equations [5], random walks, Levy flights, supper diffuse transport and complex system.

We begin with the Mittag–Leffler functions  $E_\alpha(z)$  and  $E_{\alpha,\beta}(z)$  are defined by the following series:

$$E_\alpha(z) = \sum_{n=0}^{\infty} \frac{z^n}{\Gamma(\alpha n + 1)} z \in \mathbb{C}; \Re(\alpha) > 0 \quad (1.1.1)$$

and

$$E_{\alpha,\beta}(z) = \sum_{n=0}^{\infty} \frac{z^n}{\Gamma(\alpha n + \beta)} z, \beta \in \mathbb{C}; \Re(\alpha) > 0, \quad (1.1.2)$$

respectively. For further study of Mittag–Leffler function such as generalizations and applications , the readers may refer to the current work of researchers (for example) Džrbašjan [7], Kilbas and Saigo [15], Gorenflo and Mainardi [8] , Gorenflo et al. ([9,11]), Kilbas et al. ([16], and Saigo and Kilbas [22]. In recent years, the Mittag–Leffler function (1.1.1) and some of its variety of generalizations have been numerically investigated in the complex plane (see [14,24]). A generalization of the Mittag–Leffler function  $E_{\alpha,\beta}(z)$  of (1.1.2) was introduced by Prabhakar [20] as follows:

$$E_{\alpha,\beta}^\gamma(z) = \sum_{n=0}^{\infty} \frac{(\gamma)_n z^n}{\Gamma(\alpha n + \beta) n!} z, \beta \in \mathbb{C}; \Re(\alpha) > 0, \quad (1.1.3)$$

where  $(\gamma)_n$  denote the well-known Pochhammer Symbol which is defined by

$$(\gamma)_n = \begin{cases} 1, & \text{when } (n = 0, \gamma \neq 0) \\ \gamma(\gamma + 1) \dots (\gamma + n - 1), & \text{when } (n \in \mathbb{N}, \gamma \in \mathbb{C}) \end{cases} .$$

Obviously, the following special cases are satisfied:

$$E_{\alpha,\beta}^1(z) = E_{\alpha,\beta}(z) = E_{\alpha,1}^1(z) = E_\alpha(z). \quad (1.1.4)$$

Diaz and Pariguan [see nisar (k, s) fractional calculus] have introduced the Pochhammer  $p$ -symbols and  $p$ -Gamma function defined as follows

$$(\gamma)_{np} = \begin{cases} 1, & \text{when } (n = 0, \gamma \neq 0) \\ \gamma(\gamma + p) \dots (\gamma + (n - 1)p), & \text{when } (n \in \mathbb{N}, \gamma \in \mathbb{C}, p > 0) \end{cases}$$

And

$$\Gamma_p(\gamma) = \int_0^\infty t^{\gamma-1} e^{-\frac{t^p}{p}} dt$$

In recent times many researchers have investigated the importance and great consideration of Mittag-Leffler function in the theory of special functions for exploring the generalization and some applications. Many extensions for these functions are found in [1-4,10]. Srivastava and Tomovski [25] have defined further generalization of the Mittag-Leffler function  $E_{\alpha,\beta}^Y(z)$  of (3), which is defined as follows:

$$E_{\alpha,\beta}^{Y,\kappa}(z) = \sum_{n=0}^{\infty} \frac{(\gamma)_{nk}}{\Gamma(c\alpha n + \beta)} \frac{z^n}{n!}, \quad (1.1.5)$$

where  $z, \beta, \gamma \in \mathbb{C}; \Re(\alpha) > \max\{0, \Re(\kappa) - 1\}; \Re(\kappa) > 0$ .

In the same paper, they have used the well-known right-sided Riemann-Liouville fractional integral, derivative and generalized Riemann-Liouville derivative operators (see [12,13,16,23]). Very recently Özarslan and Yilmaz [19] have investigated an extended Mittag-Leffler function  $E_{\alpha,\beta}^{Y,c}(z; p)$ , which is defined as follows:

$$E_{\alpha,\beta}^{Y,c}(z; p) = \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma)}{B_p(\gamma, c - \gamma)} \frac{(c)_n}{\Gamma(c\alpha n + \beta)} \frac{z^n}{n!}, \quad (1.1.6)$$

where  $p \geq 0, \Re(c) > \Re(\gamma) > 0$  and  $B_p(x, y)$  is extended beta function defined in [6] as follows:

$$B_p(x, y) = \int_0^1 t^{x-1} (1-t)^{y-1} e^{-\frac{p}{t}(1-t)} dt \quad (1.1.7)$$

for  $\Re(p) > 0, \Re(x) > 0$  and  $R(y) > 0$ . In the same paper, they defined the following result for the extended Mittag-Leffler function (1.1.6) as follows:

$$\left(\frac{d}{dz}\right)^n (z^{\lambda-1} E_{\alpha,\beta}^{Y,c}(\omega z^\alpha; p)) = z^{\lambda-n-1} E_{\alpha,\beta-n}^{Y,c}(\omega z^\alpha; p). \quad (1.1.8)$$

In this continuation of the study on the significance of fractional calculus, we start with the following preliminaries:

In this paper we investigated an extended Mittag-Leffler function  $E_{\alpha,\beta}^{Y,\delta;c,d}(z; p, q)$ , which is defined as follows:

$$E_{\alpha,\beta}^{Y,\delta;c,d}(z; p, q) = \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma)}{B_p(\gamma, c - \gamma)} \frac{B_q(\delta + n, d - \delta)}{B_q(\delta, d - \delta)} \frac{(c)_n (d)_n}{\Gamma(c\alpha n + \beta)} \frac{z^n}{n!}, \quad (1.1.9)$$

where  $p, q \geq 0, \Re(c) > \Re(\gamma) > 0, \Re(d) > \Re(\delta) > 0$  and  $B_p(x, y)$  and  $B_q(x, y)$  are extended beta function defined as follows,

$$B_p(x, y) = \int_0^1 t^{x-1} (1-t)^{y-1} e^{-\frac{p}{t}(1-t)} dt$$

And

$$B_q(x, y) = \int_0^1 t^{x-1} (1-t)^{y-1} e^{-\frac{q}{t}(1-t)} dt$$

For  $\Re(p) > 0, \Re(x) > 0$  and  $\Re(y) > 0$ .

**Remark 1.1.1:** It should be noted that,

$$E_{\alpha,\beta}^{1,1;c,d}(z, 1, 1) = E_{\alpha,\beta}^{1,1}(z) = E_{\alpha,\beta}^{1,c}(z; 1) = E_{\alpha,1}^1(z) = E_{\alpha,1} = E_\alpha(z) \quad (1.1.9) \Rightarrow (1.1.6) \Rightarrow (1.1.3) \Rightarrow (1.1.2) \Rightarrow (1.1.1)$$

Or

$$(1.1.9) \Rightarrow (1.1.5) \Rightarrow (1.1.3) \Rightarrow (1.1.2) \Rightarrow (1.1.1)$$

$L(a, b)$  is the space of Lebesgue measurable of real or complex valued function if it is defined as

$$\mathcal{L}(a, b) = \left\{ f: \|f\|_1 = \int_a^b f(x) dx < \infty \right\}. \quad (1.1.10)$$

The left- and right-sided Riemann–Liouville fractional integral operators  $I_{a+}^\lambda$  and  $I_{b-}^\lambda$  are, respectively, defined as (see, e.g., [16]) follows:

$$(I_{a+}^\lambda f)(x) = \frac{1}{\Gamma(\lambda)} \int_a^x \frac{f(\tau)}{(\tau-x)^{1-\lambda}} d\tau, (x > a), \quad (1.1.11)$$

and

$$(I_{b-}^\lambda f)(x) = \frac{1}{\Gamma(\lambda)} \int_x^b \frac{f(\tau)}{(\tau-x)^{1-\lambda}} d\tau, (x < b), \quad (1.1.12)$$

where  $f(x) \in \mathcal{L}(a, b)$ ,  $\lambda \in \mathbb{C}$  and  $\Re(\lambda) > 0$ .

Similarly, for  $f(x) \in \mathcal{L}(a, b)$ ,  $\lambda \in \mathbb{C}$ ,  $\Re(\lambda) > 0$  and  $n = [\Re(\lambda)] + 1$ , the left- and right-sided Riemann–Liouville fractional differential are defined as (see, e.g., [16]) follows:

$$(D_{a+}^\lambda f)(x) = \left( \frac{d}{dx} \right)^n (I_{a+}^{n-\lambda} f)(x), \quad (1.1.13)$$

$$(D_{a-}^\lambda f)(x) = \left( -\frac{d}{dx} \right)^n (I_{a-}^{n-\lambda} f)(x), \quad (1.1.14)$$

respectively.

A generalized form of fractional differential operator  $D_{a+}^\lambda$  (1.1.13) has been made by investigating the fractional differential operator  $D_{a+}^{\lambda, v}$  of order  $0 < \lambda < 1$  and type  $0 < v < 1$  with respect to  $x$  as follows:

$$(D_{a+}^{\lambda, v} f)(x) = \left( I_{a+}^{v(1-\lambda)} \frac{d}{dx} (I_{a+}^{(1-v)(1-\lambda)} f) \right) (x) \quad (1.1.15)$$

(see [23], [16], [21]). Obviously, when  $v = 0$  then (1.1.15) reduces to the operator  $D_{a+}^\lambda$  defined in (1.1.12).

We consider the following basic results for our study:

**Theorem 1.1.2** (Mathai and Haubold [17]) If  $\lambda, \mu \in \mathbb{C}$ ,  $\Re(\lambda) > 0$ ,  $\Re(\mu) > 0$ , then

$$I_{a+}^\lambda (\tau - a)^{\mu-1} = \frac{\Gamma(\mu)}{\Gamma(\lambda + \mu)} (x - a)^{\lambda+\mu-1}. \quad (1.1.16)$$

**Theorem 1.1.3** (Srivastava and Manocha [26]) If a function is  $f(z)$  is analytic and has a power series expansion such that  $f(z) = \sum_{n=0}^{\infty} a_n z^n$  in the disc  $|z| < \Re$ , then

$$D_{0,z}^\lambda \{z^{\mu-1} f(z)\} = \frac{\Gamma(\mu)}{\Gamma(\lambda + \mu)} \sum_{n=0}^{\infty} \frac{a_n (\mu)_n}{(\lambda + \mu)_n} z^n. \quad (1.1.17)$$

**Lemma 1.1.4** (Srivastava and Tomovski [25]) The following result holds true for fractional derivative operator  $D_{a+}^{\mu, v} f$  as follows:

$$D_{a+}^{\lambda, v} [(\tau - a)^{\beta-1}] (x) = \frac{\Gamma(\beta)}{\Gamma(\beta - \lambda)} (x - a)^{\beta - \lambda - 1}, \quad (1.1.18)$$

where  $x > a$ ,  $0 < \lambda < 1$ ,  $0 \leq v \leq 1$ ,  $\Re(\beta) > 0$  and  $\Re(\lambda) > 0$ .

## II. AN INTEGRAL AND DIFFERENTIAL OPERATORS INVOLVING THE EXTENDED MITTAG-LEFFLER FUNCTION

In this section, we introduce fractional integrals and differentials of the extended Mittag–Leffler functions  $E_{\alpha, \beta}^{\gamma, \delta; c, d}(z; p, q)$ . In this continuation of the study of fractional calculus, we define the following integral operator as follows:

**Definition 2.1.1** If  $\gamma, \omega \in \mathbb{C}$ ,  $\Re(\alpha) > 0$ ,  $\Re(\beta) > 0$ , then

$$(E_{a+; \alpha, \beta}^{\omega; \gamma, \delta; c, d} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha, \beta}^{\gamma, \delta; c, d} (\omega(x - \tau)^\alpha; p, q) f(\tau) d\tau, \quad (1.1.19)$$

where  $x > \alpha$ . Substituting  $p = q = 0$ , then (1.1.19) reduces to the operator

$$(E_{a+; \alpha, \beta}^{\omega; \gamma, \delta} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha, \beta}^{\gamma, \delta} (\omega(x - \tau)^\alpha) f(\tau) d\tau, \quad (1.1.20)$$

see [25]. In fact, when  $\omega = 0$  then the integral operator in (1.1.20) reduces to the well known Riemann–Liouville fractional integral operator  $I_{a+}^\lambda$  defined in (1.1.11).

**Theorem 2.2.2** Suppose  $x > a$  ( $a \in \mathbb{R}_+ = [0, \infty)$ ),  $\gamma, \delta, \lambda, \beta, \omega \in \mathbb{C}$ ,  $\Re(\beta) > 0$ ,  $\Re(\lambda) > 0$ ; then

$$I_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] (x) = (x - a)^{\lambda+\beta-1} E_{\alpha,\beta+\lambda}^{\gamma,\delta;c,d} \left( (\omega(x - a)^\alpha); p, q \right) \quad (1.1.21)$$

$$D_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] = (x - a)^{\beta-\lambda-1} E_{\alpha,\beta-\lambda}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right) \quad (1.1.22)$$

and

$$D_{a+}^{\lambda,v} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] (x) = (x - a)^{\beta-\lambda-1} E_{\alpha,\beta-\lambda}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right). \quad (1.1.23)$$

**Proof**

$$\begin{aligned} I_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] &= \frac{1}{\Gamma(\lambda)} \int_a^x \frac{(\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right)}{(x - \tau)^{1-\lambda}} d\tau \\ &= \frac{1}{\Gamma(\lambda) B_p(\gamma, c - \gamma) B_q(\delta, d - \delta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{\Gamma(\alpha n + \beta) n!} \\ &\quad \times \int_0^x (\tau - a)^{\beta + an - 1} (x - \tau)^{\lambda - 1} d\tau \\ &= \frac{1}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{\Gamma(\alpha n + \beta) n!} \\ &\quad \times \left( I_{a+}^{\lambda} \left[ (\tau - a)^{\beta + an - 1} \right] \right). \end{aligned}$$

By the use of (1.1.16), we have

$$\begin{aligned} I_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] &= \frac{1}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{\Gamma(\alpha n + \beta) n!} (x - a)^{\beta + \lambda + \alpha n - 1} \frac{\Gamma(\alpha n + \beta)}{\Gamma(\alpha n + \beta + \lambda)} \\ &= (x - a)^{\beta + \lambda - 1} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta)}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta)} \frac{(c)_{np} (d)_{nq}}{\Gamma(\alpha n + \beta + \lambda)} \frac{[\omega(x - a)^\alpha]^n}{n!} \\ &= (x - a)^{\beta + \lambda - 1} E_{\alpha,\beta+\lambda}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right). \end{aligned}$$

This completes the proof of (1.1.21).

Now, we have

$$D_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta,p,q}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] = \left( \frac{d}{dx} \right)^n \left\{ I_{a+}^{n-\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] \right\}$$

and using (1.1.21) this takes the following form:

$$D_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] = \left( \frac{d}{dx} \right)^n \left\{ (x - a)^{\beta - \lambda + n - 1} E_{\alpha,\beta-\lambda+n}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right) \right\}.$$

Applying (1.1.9), we have

$$D_{a+}^{\lambda} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; c, d \right) \right] (x) = (x - a)^{\beta - \lambda - 1} E_{\alpha,\beta-\lambda}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right).$$

This completes the desired proof.

To prove (1.1.23), we have

$$\begin{aligned} \left( D_{a+}^{\lambda,v} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] \right) (x) &= D_{a+}^{\lambda,v} \left( \left[ \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \frac{1}{n!} (\tau - a)^{\alpha n + \beta - 1} \right] \right) (x) \\ &= \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \left( D_{a+}^{\lambda,v} \left[ (\tau - a)^{\alpha n + \beta - 1} \right] \right) (x). \end{aligned}$$

By applying (1.1.18), we get

$$\begin{aligned} \left( D_{a+}^{\lambda,v} \left[ (\tau - a)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} \left( \omega(\tau - a)^\alpha; p, q \right) \right] \right) (x) &= \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \cdot \frac{\Gamma(\alpha n + \beta)}{\Gamma(\alpha n + \beta - \lambda)} (x - a)^{\alpha n + \beta - \lambda - 1} \\ &= (x - a)^{\beta - \lambda - 1} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq} \omega^n}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta - \lambda)} \frac{[\omega(x - a)^\alpha]^n}{n!} \\ &= (x - a)^{\beta - \lambda - 1} E_{\alpha,\beta-\lambda}^{\gamma,\delta;c,d} \left( \omega(x - a)^\alpha; p, q \right), \end{aligned}$$

which completes the required proof.

### 1. Some properties of the operator $(\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} f)(x)$

**Theorem 2.3.1** If  $\gamma, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(\lambda) > 0$  and  $\Re(\beta) > 0$ , then

$$(\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d}[(\tau - a)^{\mu-1}])(x) = (x - a)^{(\mu+\beta-1)} \Gamma(\mu) E_{\alpha,\beta+\mu}^{\gamma,\delta;c,d}(\omega(x - a)^\mu; p, q) f(\tau) d\tau. \quad (1.1.24)$$

**Proof** From (1.1.19)

$$(\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d}(\omega(x - \tau)^\alpha; p, q) f(\tau) d\tau.$$

Therefore, we have

$$\begin{aligned} (\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d}[(\tau - a)^{\mu-1}])(x) &= \int_a^x (x - \tau)^{\beta-1} (\tau - a)^{\mu-1} E_{\alpha,\beta}^{\gamma,\delta;c,d}(\omega(x - \tau)^\alpha; p, q) d\tau \\ &= \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \frac{\omega^n}{n!} \left( \int_a^x (\tau - a)^{\mu-1} (x - \tau)^{\beta+\alpha n-1} d\tau \right) \\ &\quad \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \frac{\omega^n}{n!} I_{a+}^{\alpha n+\beta} [(\tau - a)^{\mu-1}] \\ &= (x - a)^{\beta+\mu-1} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \frac{[\omega(x - a)^\alpha]^n}{n!} \frac{\Gamma(\mu) \Gamma(\alpha n + \beta)}{\Gamma(\alpha n + \beta + \mu)} \\ &= (x - a)^{\beta+\mu-1} \Gamma(\mu) E_{\alpha,\beta+\mu}^{\gamma,\delta;c,d}(\omega(x - a)^\alpha; p, q). \end{aligned}$$

This completes the desired proof. \_

**Theorem 2.3.2** If  $\gamma, \alpha, \beta, \omega, c \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(c) > 0$ , then  $\|\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} \varphi\|_1 \leq B \|\varphi\|_1$ , where

$$B = (b - a)^{R(\beta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta) (R(\beta) + R(\alpha)n)} \frac{|\omega(b - a)^\alpha|^n}{n!} \quad (1.1.25)$$

**Proof** From (1.1.19) and (1.1.10) and by changing the order of integration by using the Dirichlet formula [18], we have

$$\begin{aligned} \|\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} \varphi\|_1 &= \int_a^b \left| \int_a^x (x - \tau)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d}(\omega(x - \tau)^\alpha; p, q) \varphi(\tau) d\tau \right| dx \\ &\leq \int_a^b \left[ \int_\tau^b (x - \tau)^{R(\beta)-1} \left| E_{\alpha,\beta}^{\gamma,\delta;c,d}(\omega(x - \tau)^\alpha; p, q) \right| dx \right] |\varphi(\tau)| d\tau. \end{aligned}$$

Substituting  $(x - \tau) = u$ , we obtain

$$= \int_a^b \left[ \int_0^{b-\tau} (u)^{R(\beta)-1} \left| E_{\alpha,\beta}^{\gamma,\delta;c,d}(\omega(u)^\alpha; p, q) \right| du \right] |\varphi(\tau)| d\tau.$$

After simplification, we have

$$\|\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} \varphi\|_1 \leq \int_a^b \left[ \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta)} \frac{|\omega^n|}{n!} \left( \frac{(u)^{R(\beta)+R(\alpha)n}}{R(\beta)+R(\alpha)n} \right)_0^{b-a} \right] |\varphi(\tau)| d\tau.$$

This can also be written as

$$\begin{aligned} \|\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} \varphi\|_1 &\leq \\ (b - a)^{R(\beta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta) (R(\beta) + R(\alpha)n)} \frac{|\omega(b - a)^\alpha|^n}{n!} &\cdot \int_a^b |\varphi(\tau)| d\tau \\ &= B \|\varphi\|_1, \end{aligned}$$

where

$$B = (b - a)^{R(\beta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) B_q(\delta + n, d - \delta) (c)_{np} (d)_{nq}}{B_p(\gamma, c - \gamma) B_q(\delta, d - \delta) \Gamma(\alpha n + \beta) (R(\beta) + R(\alpha)n)} \frac{|\omega(b - a)^\alpha|^n}{n!}. \quad (1.1.26)$$

This completes the desired proof.

**Theorem 2.3.3** If  $\lambda, \gamma, \alpha, \beta, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(\gamma) > 0, \Re(\lambda) > 0$  and  $x > a$ , then

$$(I_{a+}^\lambda [\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} f])(x) = (\mathbf{\epsilon}_{a+;\alpha,\beta+\mu}^{\omega;\gamma,\delta;c,d} f)(x) = (\mathbf{\epsilon}_{a+;\alpha,\beta}^{\omega;\gamma,\delta;c,d} [I_{a+}^\lambda f])(x) \quad (1.1.27)$$

holds for any function  $f \in L(\alpha, \beta)$ .

**Proof** From (1.1.19) and (1.1.11), we have

$$\begin{aligned} \left( I_{a+}^{\lambda} \left[ \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f \right] \right) (x) &= \frac{1}{\Gamma(\lambda)} \int_a^x \frac{\mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f(\tau)}{(x-\tau)^{1-\mu}} d\tau \\ &= \frac{1}{\Gamma(\lambda)} \int_a^x (x-\tau)^{\lambda-1} \times \left\{ \int_{\alpha}^{\tau} (\tau-u)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\tau-u)^{\alpha}; p, q) f(u) du \right\} d\tau. \end{aligned}$$

By interchanging the order of integration and applying the Dirichlet formula [19], we have

$$\left( I_{a+}^{\lambda} \left[ \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f \right] \right) (x) = \int_a^x \left[ \frac{1}{\Gamma(\lambda)} \int_u^x (x-\tau)^{(\lambda-1)} (\tau-u)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\tau-u)^{\alpha}; p, q) d\tau \right] f(u) du.$$

Substituting  $(\tau-u) = \rho$ , we obtain

$$\begin{aligned} \left( I_{a+}^{\lambda} \left[ k \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f \right] \right) (x) &= \int_a^x \left[ \frac{1}{\Gamma(\lambda)} \int_0^{x-u} (x-u-\rho)^{\lambda-1} (\rho)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\rho)^{\alpha}; p, q) d\rho \right] f(u) du \\ &= \int_a^x \left[ \frac{1}{\Gamma(\lambda)} \int_0^{x-u} (\rho)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\rho)^{\alpha}; p, q) (x-u-\rho)^{1-\lambda} d\rho \right] f(u) du. \end{aligned} \quad (1.1.28)$$

By the use of (1.1.11) and applying (1.1.21), we get

$$\begin{aligned} \left( I_{a+}^{\lambda} \left[ \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f \right] \right) (x) &= \int_a^x \left[ (\rho)^{\lambda+\beta-1} E_{\alpha,\beta+\lambda}^{\gamma,\delta;c,d} (\omega(\rho)^{\alpha}; p, q) \right] f(u) du \\ &= \int_a^x (x-u)^{\lambda+\beta-1} E_{\alpha,\beta+\lambda}^{\gamma,\delta;c,d} (\omega(x-u)^{\alpha}; p, q) f(u) du; \end{aligned}$$

thus, we get

$$\left( I_{a+}^{\lambda} \left[ \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} f \right] \right) (x) = \left( \mathbf{E}_{a+\alpha,\beta+\lambda}^{\omega,\gamma,\delta;c,d} f \right) (x), \quad (1.1.29)$$

this is the required proof of (1.1.27).

To prove the second part, we begin from the right-hand side of (1.1.27) and using (1.1.19), we have

$$\begin{aligned} \left( \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} \left[ I_{a+}^{\lambda} f \right] \right) (x) &= \int_a^x (x-\tau)^{\beta-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(x-\tau)^{\alpha}; p, q) [I_{a+}^{\lambda} f](\tau) d\tau \\ &= \int_a^x E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(x-\tau)^{\alpha}; p, q) \left( \frac{1}{\Gamma(\lambda)} \int_a^{\tau} \frac{f(u)}{(\tau-u)^{1-\mu}} du \right) d\tau. \end{aligned}$$

By interchanging the order of integration and using the Dirichlet formula [18], we obtain

$$\left( \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} \left[ I_{a+}^{\lambda} f \right] \right) (x) = \int_a^x \frac{1}{\Gamma(\lambda)} \left[ \int_u^x (x-\tau)^{\beta-1} (\tau-u)^{\lambda-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(x-\tau)^{\alpha}; p, q) d\tau \right] \times f(u) du.$$

Substituting  $(x-\tau) = \rho$

$$\begin{aligned} \left( \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} \left[ I_{a+}^{\lambda} f \right] \right) (x) &= \int_a^x \frac{1}{\Gamma(\lambda)} \left[ \int_{x-u}^0 (\rho)^{\beta-1} (x-\rho-u)^{\lambda-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\rho)^{\alpha}; p, q) (-d\rho) \right] \times f(u) du \\ &= \int_a^x \frac{1}{\Gamma(\lambda)} \left[ \int_0^{x-u} (\rho)^{\beta-1} (x-\rho-u)^{\lambda-1} E_{\alpha,\beta}^{\gamma,\delta;c,d} (\omega(\rho)^{\alpha}; p, q) d\rho \right] \times f(u) du. \end{aligned}$$

Again by making use of (1.1.11) and applying (1.1.21), we get

$$\left( \mathbf{E}_{a+\alpha,\beta}^{\omega,\gamma,\delta;c,d} \left[ I_{a+}^{\lambda} f \right] \right) (x) = \left( \mathbf{E}_{a+\alpha,\beta+\lambda}^{\omega,\gamma,\delta;c,d} f \right) (x).$$

Thus (1.1.29) and (1.1.30) complete the desired proof of (1.1.27).

### III. SPECIAL CASES

If we put  $\delta = q = 1$  in Theorem 2.2.2 then we get following result.

**Theorem 2.4.1** Suppose  $x > \alpha$  ( $\alpha \in \mathcal{R}_+ = [0, \infty)$ ),  $\gamma, \lambda, \beta, \omega \in \mathbb{C}$ ,  $\Re(\beta) > 0$ ,  $\Re(\lambda) > 0$ ; then

$$\begin{aligned} I_{a+}^{\lambda} \left[ (\tau-a)^{\beta-1} E_{\alpha,\beta}^{\gamma,c} (\omega(\tau-a)^{\alpha}; p) \right] (x) &= (x-a)^{\lambda+\beta-1} E_{\alpha,\beta+\lambda}^{\gamma,c} (\omega(x-a)^{\alpha}); p \\ D_{a+}^{\lambda} \left[ (\tau-a)^{\beta-1} E_{\alpha,\beta}^{\gamma,c} (\omega(\tau-a)^{\alpha}; p) \right] &= (x-a)^{\beta-\lambda-1} E_{\alpha,\beta-\lambda}^{\gamma,c} (\omega(x-a)^{\alpha}); p \end{aligned}$$

and

$$D_{a+}^{\lambda,v} \left[ (\tau-a)^{\beta-1} E_{\alpha,\beta}^{\gamma,c} (\omega(\tau-a)^{\alpha}; p) \right] (x) = (x-a)^{\beta-\lambda-1} E_{\alpha,\beta-\lambda}^{\gamma,c} (\omega(x-a)^{\alpha}); p.$$

If we put  $\gamma = p = \delta = q = 1$  in theorem 2.2.2 then we get following result.

**Theorem 2.4.2** Suppose  $x > \alpha$  ( $\alpha \in \mathcal{R}_+ = [0, \infty)$ ),  $\gamma, \lambda, \beta, \omega \in \mathbb{C}$ ,  $\Re(\beta) > 0$ ,  $\Re(\lambda) > 0$ ; then

$$\begin{aligned} I_{a+}^{\lambda} \left[ (\tau-a)^{\beta-1} E_{\alpha,\beta} (\omega(\tau-a)^{\alpha}) \right] (x) &= (x-a)^{\lambda+\beta-1} E_{\alpha,\beta+\lambda} (\omega(x-a)^{\alpha}) \\ D_{a+}^{\lambda} \left[ (\tau-a)^{\beta-1} E_{\alpha,\beta} (\omega(\tau-a)^{\alpha}) \right] &= (x-a)^{\beta-\lambda-1} E_{\alpha,\beta-\lambda} (\omega(x-a)^{\alpha}) \end{aligned}$$

and

$$D_{a+}^{\lambda, \nu} [(\tau - a)^{\beta-1} E_{\alpha, \beta}(\omega(\tau - a)^\alpha)](x) = (x - a)^{\beta-\lambda-1} E_{\alpha, \beta-\lambda}(\omega(x - a)^\alpha).$$

If we take  $\delta = d = 1$  in Definition 2.1.1 then we get the following definition

**Definition 2.4.3** If  $\gamma, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0$ , then

$$(\epsilon_{a+; \alpha, \beta}^{\omega, \gamma; c} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha, \beta}^{\gamma; c}(\omega(x - \tau)^\alpha; p) f(\tau) d\tau,$$

where  $x > \alpha$ . Substituting  $p = 0$ , then (19) reduces to the operator

$$(\epsilon_{a+; \alpha, \beta}^{\omega, \gamma} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha, \beta}^{\gamma, \delta}(\omega(x - \tau)^\alpha) f(\tau) d\tau,$$

If we take  $\gamma = c = \delta = d = 1$  in Definition 2.1.1 then we get the following definition

**Definition 2.4.4** If  $\gamma, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0$ , then

$$(\epsilon_{a+; \alpha, \beta}^{\omega} f)(x) = \int_a^x (x - \tau)^{\beta-1} E_{\alpha, \beta}(\omega(x - \tau)^\alpha) f(\tau) d\tau$$

If we take  $\delta = d = 1$  in Definition 2.3.1 then we get the following results

**Theorem 2.4.5** If  $\gamma, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(\lambda) > 0$  and  $\Re(\beta) > 0$ , then

$$(\epsilon_{a+; \alpha, \beta}^{\omega, \gamma; c}[(\tau - a)^{\mu-1}])(x) = (x - a)^{(\mu+\beta-1)} \Gamma(\mu) E_{\alpha, \beta+\mu}^{\gamma; c}(\omega(x - a)^\mu; p) f(\tau) d\tau.$$

If we take  $\gamma = c = \delta = d = 1$  in Theorem 2.3.2 then we get the following results

**Theorem 2.4.6** If  $\gamma, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(\lambda) > 0$  and  $\Re(\beta) > 0$ , then

$$(\epsilon_{a+; \alpha, \beta}^{\omega}[(\tau - a)^{\mu-1}])(x) = (x - a)^{(\mu+\beta-1)} \Gamma(\mu) E_{\alpha, \beta+\mu}(\omega(x - a)^\mu) f(\tau) d\tau.$$

If we take  $\delta = d = 1$  in Theorem 2.3.2 then we get the following results

**Theorem 2.4.7** If  $\gamma, \alpha, \beta, \omega, c \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(c) > 0$ , then

$$\left\| \epsilon_{a+; \alpha, \beta}^{\omega, \gamma; c} \varphi \right\|_1 \leq B \|\varphi\|_1,$$

where

$$B = (b - a)^{\Re(\beta)} \sum_{n=0}^{\infty} \frac{B_p(\gamma + n, c - \gamma) |(c)_{np}|}{B_p(\gamma, c - \gamma) \Gamma(\alpha n + \beta) (\Re(\beta) + \Re(\alpha)n)} \frac{|\omega(b - a)^\alpha|^n}{n!}.$$

If we take  $\gamma = c = \delta = d = 1$  in Theorem 2.3.2 then we get the following results

**Theorem 2.4.8** If  $\lambda, \gamma, \alpha, \beta, \omega \in \mathbb{C}, \Re(\alpha) > 0, \Re(\beta) > 0, \Re(\gamma) > 0, \Re(\lambda) > 0$  and  $x > a$ , then

$$(I_{a+}^\lambda [\epsilon_{a+; \alpha, \beta}^{\omega} f])(x) = (\epsilon_{a+; \alpha, \beta+\mu}^{\omega} f)(x) = (\epsilon_{a+; \alpha, \beta}^{\omega} [I_{a+}^\lambda f])(x)$$

holds for any function  $f \in L(\alpha, \beta)$ .
