APPLICATIONS OF LINEAR TRANSFORMATIONS

Ms. Reetu

M.sc mathematics, CSIR-UGC NET

Assistant professor, C.R.S.U., JIND

ABSTRACT

In this paper, we applied linear transformations in the graph theory. Firstly, we constructed vector spaces of a finite number of elements over the field $\mathcal{F} = \{0,1\}$. Then we used them to construct linear transformations (in fact linear operators), defined on each of the vector spaces of the degrees of the vertices; $(D_v, +_v, \cdot_v)$; the vector space of the vertices; (V, \oplus, \odot) ; and the vector space of the number of the paths between the vertex a and the other vertices; $(P_a, +_p, \cdot_p)$; The last linear transformations is defined from V into D_v .

INTRODUCTION

Linear transformations appeared prominently in the analytic geometry of the seventeenth and eighteenth centuries. Linear transformations also show up in projective geometry, founded in the seventeenth century and described analytically in the early nineteenth (Kleiner, I. 2007).

The idea of representing a linear substitution (i.e., a linear transformation) by the square array of its defining coefficients is already found in Gauss's treatment of the arithmetical theory of quadratic forms in 1801 (Hawkins, T. 1974). Laguerre in France and Frobenius in Switzerland, further developed the consequences of the symbolical algebra of linear substitutions in a fashion similar to that taken by Cayley but without a knowledge of Cayley's memoir. Laguerre's work, which was published in 1867 in the journal of the Ecole Polytechnique, suffered the same fate as Cayley's 1858 memoir (Hawkins, T. 1974).

Preliminaries

Definition 2.1 (Faber, V. 2011) Undirected graph G is a nonempty set V called vertices together with a set E of 2-element subsets of V called edges.

Definition 2.2 (Chartrand, G., & Zhang, P. 2019) Two vertices u and v in undirected graph G are called adjacent in G if $\{u, v\}$ is an edge of G .

Definition 2.3 (Chartrand, G., & Zhang, P. 2019) The degree of a vertex v in undirected graph G is the number of vertices in G that are adjacent to v , and denoted by

$\deg(v)$ or $d(v)$.

Main Results (Applications)

3.1 Construction a linear operator on D_v

Figure (3.1) undirected G

Consider the following graph

- $\text{deg}(a) = 1,$
- $\text{deg}(b) = 2,$
- $\text{deg}(c) = 3,$
- $\text{deg}(d) = 3,$
- $\text{deg}(e) = 1,$
- $\text{deg}(f) = 2,$ and
- $\text{deg}(h) = 0 .$

We considered the elements of D_V as the degrees of vertices in the undirected graph G . Then $D_V = \{0,1,2,3\}$. Define the operations $+_V$ and $._V$ on D_V by:

For any x, y in D_V

$$x +_V y = \begin{cases} \min\{x, y\}, & x \neq y \\ 0 & , x = y \end{cases}$$

And for any x in D_V and r in \mathcal{F}

$$r ._V x = \begin{cases} 0 & , r = 0 \\ x & , r = 1 \end{cases}$$

over the field $\mathcal{F} = \{0,1\}$ with operations $+_{\mathcal{F}}$ and $._{\mathcal{F}}$ which are defined by

$+_{\mathcal{F}}$	0	1
0	0	1
1	1	0

$._{\mathcal{F}}$	0	1
0	0	0
1	0	1

Then $(D_V, +_V, ._V)$ is a vector space over \mathcal{F} :

- a- Let $x, y \in D_V, x +_V y = \min\{x, y\} \in D_V$ or $x +_V y = 0 \in D_V$, then $x +_V y$ in D_V . Thus $+_V$ is closed.
- b- Let $x, y \in D_V, x +_V y = \min\{x, y\} = y +_V x$, or $x +_V y = 0 = y +_V x$, so $+_V$ is commutitive.
- c- For any $x, y, z \in D_V, x +_V (y +_V z) = x +_V \min\{y, z\} = (x +_V y) +_V z = \min\{x, y\} +_V z$.
- d- $0 \in D_V$ such that $0 +_V x = \min\{0, x\} = 0$, for any $x \in D_V$, so 0 is the identity element.
- e- For any $x \in D_V, x +_V x = 0$. This means that every element x in D_V has an inverse which is x itself.
- f- Let $x \in D_V$ and $r \in \mathcal{F}$ then $r ._V x = \{0, x\} \in D_V$. Then $._V$ is closed.
- g- For any $r \in \mathcal{F}, x, y \in D_V$ then

$$r ._V (x +_V y) = \begin{cases} 0 & , r = 0 \\ x +_V y & , r = 1 \end{cases}$$

$$r ._V x = \begin{cases} 0 & , r = 0 \\ x & , r = 1 \end{cases}$$

$$r ._V y = \begin{cases} 0 & , r = 0 \\ y & , r = 1 \end{cases}$$

$$\Rightarrow r \cdot_V x +_V r \cdot_V y = \begin{cases} 0 & , r = 0 \\ x +_V y & , r = 1 \end{cases} \\ = r \cdot_V (x +_V y)$$

h- Let $r, k \in \mathcal{F}$, $x \in D_V$ then

$$(r +_F k) \cdot_V x = \begin{cases} 0 & , r +_F k = 0 (r = k) \\ x & , r +_F k = 1 (r \neq k) \end{cases}$$

$$r \cdot_V x = \begin{cases} 0 & , r = 0 \\ x & , r = 1 \end{cases} \\ k \cdot_V x = \begin{cases} 0 & , k = 0 \\ x & , k = 1 \end{cases}$$

$$r \cdot_V x +_F k \cdot_V x = \begin{cases} 0 & , r = k = 0 \\ x +_F x & , r = k = 1 \\ x & , r \neq k \end{cases}$$

$$= \begin{cases} 0 & , r = k = 0 \\ 0 & , r = k = 1 \\ x & , r \neq k \end{cases} \\ = \begin{cases} 0 & , r = k \\ x & , r \neq k \end{cases} = (r +_F k) \cdot_V x$$

i- For any $r, k \in \mathcal{F}$ and $x \in D_V$ then

$$r \cdot_V (k \cdot_V x) = \begin{cases} 0 & , r = 0 \\ k \cdot_V x & , r = 1 \end{cases} \\ = \begin{cases} 0 & , r = 0 \\ 0 & , r = 1, k = 0 \\ x & , r = k = 1 \end{cases} \\ = \begin{cases} x & , r = k = 1 \\ 0 & , o.w. \end{cases}$$

$$(r \cdot_F k) \cdot_V x = \begin{cases} x & , r \cdot_F k = 1 \\ 0 & , r \cdot_F k = 0 \end{cases} \\ = \begin{cases} x & , r = k = 1 \\ 0 & , o.w. \end{cases} = r \cdot_V (k \cdot_V x)$$

j-1- $r \cdot_V x = x$, for any $x \in D_V$.

The function $T: D_V \rightarrow D_V$ is defined by $T(x) = x^{-1}$ is a linear transformation on D_V :
Let $x, y \in D_V$ and $r \in \mathcal{F}$.

$$i-T(x +_V y) = \begin{cases} T(\min\{x, y\}) & , x \neq y \\ T(0) & , x = y \end{cases}$$

$$= \begin{cases} (\min\{x, y\})^{-1} & , x \neq y \\ 0 & , x = y \end{cases}$$

$$= \begin{cases} \min\{x, y\} & , x \neq y \\ 0 & , x = y \end{cases}$$

$$T(x) +_V T(y) = x^{-1} +_V y^{-1}$$

$$= \begin{cases} \min\{x^{-1}, y^{-1}\} & , x^{-1} \neq y^{-1} \\ 0 & , x^{-1} = y^{-1} \end{cases}$$

$$= \begin{cases} (\min\{x, y\})^{-1} & , x \neq y \\ 0 & , x = y \end{cases}$$

$$= \begin{cases} \min\{x, y\} & , x \neq y \\ 0 & , x = y \end{cases}$$

So, $T(x +_V y) = T(x) +_V T(y)$.

$$\text{ii- } T(r \cdot_V x) = \begin{cases} T(x) & , r = 1 \\ T(0) & , r = 0 \end{cases}$$

$$= \begin{cases} x^{-1} & , r = 1 \\ 0 & , r = 0 \end{cases}$$

$$= \begin{cases} x^{-1} & , r = 1 \\ 0 & , r = 0 \end{cases}$$

$$r \cdot_V T(x) = r \cdot_V x^{-1} = \begin{cases} x^{-1} & , r = 1 \\ 0 & , r = 0 \end{cases}$$

$$= T(r \cdot_V x).$$

Hence, T is a linear transformation on D_V .

3.2 Construction a linear operator on V

From the previous process, we can obtain a vector space (V, \oplus, \odot) on the set of vertices $V = \{a, b, c, d, e, f, h\}$, with operations \oplus and \odot which are defined by: For any $x, y \in V$, and $r \in \mathcal{F}$,

$$x \oplus y = \begin{cases} x & , \text{deg}(x) < \text{deg}(y) \\ y & , \text{deg}(y) < \text{deg}(x) \\ h & , \text{deg}(x) = \text{deg}(y) \end{cases}$$

$$r \odot x = \begin{cases} h & , r = 0 \\ x & , r = 1 \end{cases}$$

The identity element is h , the inverse of each element is given by the following table

x	x^{-1}
a	e
b	f
c	d
d	c
e	a
f	b
h	h

The function $T: V \rightarrow V$ is defined by $T(x) = x^{-1}$ is a linear transformation on V :
Let $x, y \in V$ and $r \in \mathcal{F}$,

$$\text{i- } T(x \oplus y) = \begin{cases} T(x) & , \text{deg}(x) < \text{deg}(y) \\ T(y) & , \text{deg}(x) > \text{deg}(y) \\ h & , \text{deg}(x) = \text{deg}(y) \end{cases}$$

$$= \begin{cases} x^{-1} & , \text{deg}(x) < \text{deg}(y) \\ y^{-1} & , \text{deg}(x) > \text{deg}(y) \\ h & , \text{deg}(x) = \text{deg}(y) \end{cases}$$

$$T(x) \oplus T(y) = x^{-1} \oplus y^{-1}$$

$$= \begin{cases} x^{-1} & , \text{deg}(x^{-1}) < \text{deg}(y^{-1}) \\ y^{-1} & , \text{deg}(x^{-1}) > \text{deg}(y^{-1}) \\ h & , \text{deg}(x^{-1}) = \text{deg}(y^{-1}) \end{cases}$$

$$= \begin{cases} x^{-1} & , \text{deg}(x) < \text{deg}(y) \\ y^{-1} & , \text{deg}(x) > \text{deg}(y) \\ h & , \text{deg}(x) = \text{deg}(y) \end{cases}$$

$$\text{So, } T(x \oplus y) = T(x) \oplus T(y).$$

$$\text{ii- } T(r \odot x) = \begin{cases} T(x) & , r = 1 \\ T(h) & , r = 0 \end{cases}$$

$$= \begin{cases} x^{-1} & , r = 1 \\ h & , r = 0 \end{cases}$$

$$r \odot T(x) = r \odot x^{-1} = \begin{cases} x^{-1}, & r = 1 \\ h, & r = 0 \end{cases} = T(r \odot x).$$

Hence, T is a linear transformation.

3.3 Construction a linear operator on P_a

Consider the same graph G : We considered the elements of P_a as the number of the paths between a and the other vertices in the undirected graph G . Then $P_a = \{0,1,2\}$.

Define the operations $+_p$ and \cdot_p on P_a by: For any x, y in P_a

$$x +_p y = \begin{cases} \min\{x, y\}, & x \neq y \\ 0, & x = y \end{cases}$$

And For any x in P_a and r in \mathcal{F}

$$r \cdot_p x = \begin{cases} 0, & r = 0 \\ x, & r = 1 \end{cases}$$

over the field $\mathcal{F} = \{0,1\}$. Then $(P_a, +_p, \cdot_p)$ is a vector space over \mathcal{F} .

Define $T: P_a \rightarrow P_a$ from the vector space P_a to itself by $T(x) = x^{-1}$. We have been shown that T is a linear transformation: For any x, y in P_a and r in \mathcal{F}

$$\begin{aligned} \text{i- } T(x +_p y) &= \begin{cases} T(\min\{x, y\}), & x \neq y \\ T(0), & x = y \end{cases} \\ &= \begin{cases} (\min\{x, y\})^{-1}, & x \neq y \\ 0, & x = y \end{cases} \\ &= \begin{cases} \min\{x, y\}, & x \neq y \\ 0, & x = y \end{cases} \\ T(x) +_p T(y) &= x^{-1} +_p y^{-1} = \begin{cases} \min\{x^{-1}, y^{-1}\}, & x^{-1} \neq y^{-1} \\ 0, & x^{-1} = y^{-1} \end{cases} \\ &= \begin{cases} (\min\{x, y\})^{-1}, & x \neq y \\ 0, & x = y \end{cases} \\ &= \begin{cases} \min\{x, y\}, & x \neq y \\ 0, & x = y \end{cases} \\ &= T(x +_p y) \end{aligned}$$

$$\text{So, } T(x +_p y) = T(x) +_p T(y)$$

$$\begin{aligned} \text{ii- } T(r \cdot_p x) &= \begin{cases} T(x), & r = 1 \\ T(0), & r = 0 \end{cases} = \begin{cases} x^{-1}, & r = 1 \\ 0, & r = 0 \end{cases} \\ r \cdot_p T(x) &= r \cdot_p x^{-1} = \begin{cases} x^{-1}, & r = 1 \\ 0, & r = 0 \end{cases} \\ \text{So, } r \cdot_p T(x) &= T(r \cdot_p x) \end{aligned}$$

Hence, T is a linear transformation on P_a .

3.4 Construction a linear transformation from V to D_V

Consider the same graph: For any $x, y \in V$, and $r \in \mathcal{F}$

$$x \oplus y = \begin{cases} x, & \deg(x) < \deg(y) \\ y, & \deg(y) < \deg(x) \\ h, & \deg(x) = \deg(y) \end{cases}$$

$$\text{And } r \odot x = \begin{cases} h, & r = 0 \\ x, & r = 1 \end{cases}$$

For any x, y in D_V and r in \mathcal{F}

$$x +_V y = \begin{cases} \min\{x, y\}, & x \neq y \\ 0, & x = y \end{cases}$$

$$\text{Andr.}_v x = \begin{cases} 0 & , r = 0 \\ x & , r = 1 \end{cases}$$

The function $T: V \rightarrow D_v$ which is defined by $T(x) = \text{deg}(x^{-1})$ is a linear transformation: Let $x, y \in V$, and $r \in \mathcal{F}$,

$$\begin{aligned} \text{i- } T(x \oplus y) &= \begin{cases} T(x) & , \text{deg}(x) < \text{deg}(y) \\ T(y) & , \text{deg}(x) > \text{deg}(y) \\ T(h) & , \text{deg}(x) = \text{deg}(y) \end{cases} \\ &= \begin{cases} \text{deg}(x^{-1}) & , \text{deg}(x) < \text{deg}(y) \\ \text{deg}(y^{-1}) & , \text{deg}(x) > \text{deg}(y) \\ 0 & , \text{deg}(x) = \text{deg}(y) \end{cases} \\ T(x) +_v T(y) &= \text{deg}(x^{-1}) +_v \text{deg}(y^{-1}) \\ &= \begin{cases} \min\{\text{deg}(x^{-1}), \text{deg}(y^{-1})\}, & \text{deg}(x^{-1}) \neq \text{deg}(y^{-1}) \\ 0 & , \text{deg}(x^{-1}) = \text{deg}(y^{-1}) \end{cases} \\ &= \begin{cases} \text{deg}(x^{-1}) & , \text{deg}(x^{-1}) < \text{deg}(y^{-1}) \\ \text{deg}(y^{-1}) & , \text{deg}(x^{-1}) > \text{deg}(y^{-1}) \\ 0 & , \text{deg}(x^{-1}) = \text{deg}(y^{-1}) \end{cases} \\ &= \begin{cases} x^{-1} & , \text{deg}(x) < \text{deg}(y) \\ y^{-1} & , \text{deg}(x) > \text{deg}(y) \\ 0 & , \text{deg}(x) = \text{deg}(y) \end{cases} \end{aligned}$$

So, $T(x \oplus y) = T(x) +_v T(y)$.

$$\begin{aligned} \text{ii- } T(r \odot x) &= \begin{cases} T(x) & , r = 1 \\ T(h) & , r = 0 \end{cases} \\ &= \begin{cases} \text{deg}(x^{-1}) & , r = 1 \\ 0 & , r = 0 \end{cases} \\ r \cdot_v T(x) &= r \cdot_v \text{deg}(x^{-1}) \\ &= \begin{cases} \text{deg}(x^{-1}) & , r = 1 \\ 0 & , r = 0 \end{cases} \\ &= T(r \odot x). \end{aligned}$$

Hence, T is a linear transformation.

Conclusion

Vector spaces of a finite number of elements using concepts in graph theory have been defined. Such vector spaces as far as we know were defined for the first time. These vector spaces have been used to construct linear transformation. Conversely, We can construct an undirected graph from these linear transformations.
