Developing and Evaluating Claims for A Road Project by Using PCM

Mr. Aniket S. Gawande¹, Prof. Apeksha G. Choudhary²

PG Student (Construction Management) Dept. of Civil Engineering, G.H.Raisoni University, Amravati, India¹

Assistant Professor, Dept. of Civil Engineering, G.H.Raisoni University, Amravati, India²

ABSTRACT: Construction claims have such high impacts on the project's cost and time that the contractors should establish the effective claim management in their organizations. Nowadays, the substantially increasing volume of claims are the result of the rising complexity of the projects, the price structure of the construction industry and the legal approach taken by a lot of owners and contractors Claims are becoming an inevitable and unavoidable burden in modern projects involving new technologies, specifications and high expectations from the owner It is, therefore, imperative for all the parties to be fully acquainted with the procedures and systems, including recourse to certain preventive actions as found necessary and required. Changes in the construction field can be consolidated directly or converted to a full process project. This study aims to identify the method of using the PCM program and Primavera P6 to prepare the claims in a short time with less effort to produce fully documented claims

I. INTRODUCTION

There are numerous different types of construction projects and the contractual arrangement can be done in several ways. Previous research seems to focus on traditional construction projects when addressing claim management. Compared to traditional design-bid-build, are engineering, procurement, to constructions based on basic specifications provided (Pal et al., 2017). Not much attention in previous research is given to claim management in EPC-projects where the main contractor is responsible for several outsourced activities, hence also responsible for the conflicts that arise from the outsourced activates. Whereas the main-contractor has to manage and solve conflicts that arise "internally" without creating conflicts between main-contractor and client.

Many articles on conflicts and disagreements in the construction industry exclusively deal with the circumstances characterizing a conflict and tend to ignore the causes therefore erroneously present relevant circumstances as causes (Mitkus and Mitkus, 2014). Acharya et al. (2006) used a questionnaire survey to collect professionals experience on conflicting activities, and face to face interviews to ratify the findings from the field survey. Related to EPC projects, did Shen et al. (2017) conceptualize causes of construction claims based on existing literature and empirically tested the causes with industry survey, structural equation modeling and case studies from the perspective of Chinese contractors?

II. RESEARCH METHODOLOGY

For the purposes of this research, a qualitative approach was selected as an interpretative technique of data collection in order to increase the understanding of the topic. In this study four case studies are reviewed of delivering infrastructural projects under the EPC scheme in Pune, Maharashtra.

III. PROBLEM IDENTIFICATION

- What are the root causes of claims in construction projects?(Root cause analysis study)
- What are the root causes for sub-contractor change claims in EPC construction projects?
- What are the problems associated with claim management process EPC-projects?
- What is the role of site engineer and sub-contractors in arise of claims in EPC projects? (Qualitative data)

• What improvement to be undertaken in current claim management process which was adopted commonly in various organizations?

• What are the best strategies adopted for negotiations in claim management process EPC- projects?

• What kind of claims to be come under variation due to site conditions, client change, design errors, inaccurate design information, unrealistic time targets, poor communication?

V. CONCLUSIONS

• This research work presented the impacts of construction claims on the project success and the importance of having efficient claim management within the contractor's organizations.

• From applying the case of study in PCM and analyzing claims it appeared that applying and getting results from the software consuming less time and efforts from doing the job manually. This decreases the time, efforts and number of employees assigned for claims preparation job.

• This study added a new method for tracking project documents in order to mitigate or control construction claims and apply delay analysis using one of the web-based programs which are Primavera P6.

RECOMMENDATIONS

• Applying the PCM system in their companies as early as possible, to gain the most advantages for all the project phases and especially when claims arising.

• Force all main stakeholders to get involved in the PCM system and link releasing their invoices by applying and respecting the system, and this will decrease the number of claims arising in the project.

• Continues training for employers is needed to reach the required level of document controlling in the project, it's also important to customize the program reports and forms to compatible with the Organizational Process Assets.

• More researches are needed in this felid to compare the process and reach the easiest procedure which leads to solving claims with no efforts and before reaching the disputation level.
